Next Steps

Next Steps

- **Incorporate Public Comments**
- **Confirm “Screen 1” Preliminary Findings**
- **Refine the Alternatives**
- **Continue Public Involvement**
  - Sign-in cards will be used to create a contact list to send notices and updates
  - Meetings announced through car cards, customer alerts, local media and contact list
  - Project updates on CTA web site - www.transitchicago.com

Screen 1 Meeting Schedule

Tuesday April 10, 2007
6:00 p.m. – 8:00 p.m.
Chicago State University
New Academic Library
4th Floor Auditorium
9501 South King Drive
Chicago, Illinois

Wednesday April 11, 2007
6:00 p.m. – 8:00 p.m.
West Pullman Branch
Chicago Public Library
Community Room
830 West 119th Street
Chicago, Illinois

Questions and Comments

- **CTA representatives are available to answer additional questions**
- **Written comments and questions accepted through May 11, 2007:**

Environmental Impact Statement

Final Design

Construction

Operation

Red Line Extension
Alternative Analysis Study

Purpose and Need

Transportation Needs

- Significant bus and passenger congestion at 95th Street Red Line Station
- Lengthy bus trips to access 95th Street Red Line Station
- Far South Area residents experience 20% longer commute than rest of City
- Traffic congestion is expected to grow along with study area population and employment

Opportunity for Improvement

- Extend rapid transit service south from 95th Street Red Line Station
- Improve access to, within, and beyond study area
- Stimulate economic development and job opportunities
- Shorten transit travel times through faster and more direct routings

Community Participation

Community participation is one of the key components of the alternatives analysis.

Community Outreach

- General Public
- Elected and Appointed Officials
- Community and Civic Organizations
- Faith-Based Organizations
- City and State Agencies

Ongoing Public Involvement/Input

- Meetings announced through public notices and advertisements
- Project updates on the CTA web site : www.transitchicago.com, accessible at local public libraries

Alternatives Analysis Process

Technologies Evaluated

Automated Guideway/Monorail

- Service Area: Airports, theme parks, circulators, ½ to 5 miles
- Typical Speeds: 15 to 30 mph
- Station Spacing: ½ to 2 miles

Bus Rapid Transit

- Service Area: Urban and suburban uses, 1 to 10 miles or more
- Typical Speeds: 15 to 25 mph
- Station Spacing: ¼ to 1 mile

VIA GRAND
pace
SUPERFAST REFUNDS
2388

Commuter Bus

- Service Area: Suburbs to city, 15 to 100 miles
- Typical Speeds: 30 to 50 mph
- Station Spacing: 3 to 7 miles, or at end points

Commuter Rail

- Service Area: Suburbs to city, 15 to 100 miles
- Typical Speeds: 30 to 50 mph
- Station Spacing: 3 to 7 miles

Technologies Evaluated

Heavy Rail

- Service Area: Urban uses and loadings, 1 to 10 miles or more
- Typical Speeds: 25 to 40 mph
- Station Spacing: ¼ mile downtown, up to 2 miles in neighborhoods

High Speed Rail

- Service Area: Intercity, 150 to 300 miles
- Typical Speeds: 110 to 186 mph
- Station Spacing: 20 to 50 miles

Light Rail

- Service Area: Urban or suburban uses, 1 to 10 miles or more
- Typical Speeds: 15 to 25 mph
- Station Spacing: ¼ to 1 mile

Local Bus

- Service Area: Urban and suburban uses, ½ to 5 miles
- Typical Speeds: 10 mph
- Station Spacing: 2 to 4 blocks

Technologies Evaluated

MagLev

- Service Area: Intercity, 100 to 300 miles
- Typical speeds: 250 to 340 mph
- Station Spacing: 20 to 50 miles

Personal Rapid Transit

- Service Area: Small area networks or campuses, 1 to 5 miles
- Typical Speeds: 15 mph
- Station Spacing: ¼ to 1 mile

Streetcar

- Service Area: Urban and suburban streets, ½ to 6 miles
- Typical Speeds: 10 mph
- Station Spacing: 2 to 4 blocks

Red Line Extension Alternatives Analysis Study

Screen One Public Involvement * Public Comments and Questions

November 21, 2007

No.	Comment/Question	Received Via*	Topic Area(s)
1	Heavy Rail using UP Corridor makes the most sense. Seamless ride using existing Red Line and ROW already exists.	STK	7,9
2	Will parking be available at proposed stations and at 95th Street (similar to parking at Green Line)?	STK	17
3	Would like more information on no-build and baseline and proposed station locations.	STK	6,10
4	The Community Route is the best route because it better meets the needs of the main riders - 9th Ward, 34th Ward residents. Very little home displacement while addressing 28 to 30% new ridership. (UP Rail)	STK	7,12
5	The decision to select the three corridors stated in your presentation, was there any community representation at your CTA meetings to inform the community as you prioritize your three selection of corridors?	STK	13
6	What plans are there to provide off-street parking along the Red Line? Specifically at 95th and 55th Street? Also, does the extension provide off street parking at the terminal?	STK	17
7	If extended again, will this line serve the Gary Airport and extend on to South Bend, Indiana?	STK	5
8	Is it possible to get a list of the ten alternatives? If so, please send that out.	STK	7
9	What statistics/demographics can you provide for the study area?	STK	1,5
10	After April 11 public meeting, will representatives come out to groups to provide a presentation?	STK	13
11	If non-federal funds were used, would this project move faster?	STK	14
12	Could the state/city/county do more to help fund this?	STK	14
13	What is the local match needed?	STK	14
14	I think 39,000 voters voted for the route they favor.	CSU	7
15	Extend along the Union Pacific, CSX railroad from 99th Street to 130th & Stony Island, just west of the Ford assembly plant. Also bring back "A" and "B" skip stops.	CSU	7,11,19
16	UP corridor route alternative seems best option (alternative) - heavy rail grade level or trench.	CSU	7,9
17	I believe that the "UP Corridor" route is the best alternative because it provides the best transportation alternative for the greatest number of patrons without the need to transfer at 95th . While the development of communities is not a primary concern for the CTA, the UP Corridor also provides the greatest impetus for community development.	CSU	7
18	Some of the alternative routes pictured (State St., Wentworth, Michigan) would displace existing houses and businesses, are those serious proposals?	CSU	6,12
19	Considering the UP proposal: Where would stations be located?	CSU	10
20	Considering the UP proposal: would it connect with Metra Electric?	CSU	16
21	Considering the UP proposal: would there be parking facilities at each station?	CSU	17
22	Eight final proposals were mentioned - can you please enumerate them again?	CSU	7
23	The UP option looks good. Would the CTA build an elevated line beside the tracks, as they did with the Orange Line, or is the UP line abandoned and they could simply build on the embankment?	CSU	8
24	I believe that the UP route and the heavy rail technology makes the best sense and provides for transit oriented development along with substantial ridership, with fewest displacement.	CSU	7,9,12
25	I think the UP Corridor route would be the best because it would be of greater services to the needs of the residents.	CSU	7,18
26	My community would be interested in the UP rail line. Would that line terminate in Riverdale? Or at 130th Street at the Bishop Ford expressway entrance?	CSU	7,10
27	Suggestion - If the rail is elevated with ground bus service to rail - it's the least disruptive to community and environmental.	CSU	8,9,18
28	DCP supports the UPRR Corridor because the route would benefit the far south side community, creating transit oriented development. It would also allow residents at the 130th Street stop means of getting into the City for work.	CSU	7
29	The UP Corridor is the preferred route of 39,000 residents of 2 Wards from the study area.	CSU	7

No.	Comment/Question	Received Via*	Topic Area(s)
30	UP Rail Line - our choice.	CSU	7
31	The (UP Rail) "The Community Route" is the best route because: It’s close to my home, ridership will increase and I can get to and from work faster.	CSU	7
32	The Community Route (UP Rail) is by far the best route because: I have lived and work in this area for over 40 years. Now I need and many others work in my age group (60s and 70s) need what should have happened 30 plus years ago. Just do it. I don't have long to use it for work.	CSU	7
33	The Community Route is the best route because: When I get off work, the bus that I ride home - 108 Halsted - has stopped running. I have to ride the closest bus to my house or just walk. The Red Line would run all night. I don't mind the short walk home - and there are plenty of folks like me that come home late from work.	CSU	7,19
34	We need the Community Route because: It would help me get to work and school without having to take so many buses and trains.	CSU	7
35	The Community Route is the best route because: It is the right thing to do. Don't waste time and money trying a lot of options. Most of people riding the Red Line live along the Community Route (UP Rail). I believe that means CTA will have more riders and make more money - enough said.	CSU	7
36	The Community Route is the best route for the Red Line Extension because: my community (Altgeld) will not be isolated to cut off times with transportation and easier to get to jobs, schools or wherever we need to go outside of the community.	CSU	7,18
37	To me the best way to go is where the most people are. The Community Route - UP Rail Corridor - makes the most sense. I know it would help me a great deal.	CSU	7
38	After all the studies are done, the best way to build will be the Community Route. I know it and the CTA knows it. Build the rails close to the most users, simple.	CSU	1,6,7
39	We need the Community Route because it is difficult for the elderly to get on so many buses.	CSU	7
40	The Community Route is the best route because many people will have better access to get out of the community and get better jobs.	CSU	7
41	Heavy Rail trench Michigan Street would probably serve the community best.	CSU	7,8,9
42	Why don't you reconsider taking the Red Line down the Bishop Ford Expressway and reroute buses into station? This would cause less construction hassle.	CSU	7
43	UP Corridor precludes Metra Southeast. There probably needs to be spacing at 18'6" on either side of columns. Columns may be five feet thick. 42' uses up entire so - remaining empty r-o-w Metra need two additional tracks.	CSU	7
44	I like the Cottage/Metra Electric as well as the UP Railroad to try to prevent damage to communities. Bus rapid would also work on longer routes.	CSU	7,9
45	Cottage Grove corridor further east to Olive Harvey. UP Rail corridor to Altgeld Gardens - stops west of Bishop Ford for residents encouraged.	CSU	7
46	Michigan Avenue Corridor - extend hours past school hours.	CSU	7,11
47	If the goal is to improve transit, why not increase frequency of Metra services on both sides of corridor and restructure east-west bus service connections without major capital project?	CSU	16
48	The UP Corridor is not appropriate for dense "transit-oriented" development on account of hazardous materials.	CSU	6,7,18
49	Why was commuter rail rejected? Commuter rail could have closely spread stations as Metra BNSF, UP North, and Rock Island have today. Commuter Rail doesn't require incompatible infrastructure.	CSU	9
50	Why was a viable commuter rail alternative rejected?	CSU	9
51	Can you explain the intermodal modes at 130th and UPRR?	CSU	16
52	Is intermodal transfer being evaluated at 130th and the Metra Electric Line on the Michigan Avenue alternative?	CSU	16

No.	Comment/Question	Received Via*	Topic Area(s)
53	What corridor would be the least expensive?	CSU	6,7,14
54	Will the community be able to vote on the corridor they prefer?	CSU	1,6,13
55	Use CTA Gray Line as complement to Red Line Extension.	CSU	5
56	Please contact CMAP for CTA Gray Line project ranking and information.	CSU	5
57	Utilize the Metra Electric as a CTA "L" route as proposed in the Gray Line project: www.Grayline.20M.com as included in the CMAP 2030 RTP in addition to the Red Line Extension.	CSU	5
58	Where and how will the Red Line Extension connect with the South Shore Line to Indiana?	CSU	5,16
59	Are you considering elevated trains for the Halsted and Michigan models?	CSU	8
60	What are connecting streets for the Halsted model? 95th?	CSU	7
61	When you said extending the Red Line, in my mind I am thinking the train will stop at 103rd, 111th, 119th and so on. Why can it not be extended this way?	CSU	6,9,10
62	Howard (A) east 130th Street (I-94) and Howard (B) west 127th (I-57)	CSU	7
63	I -94 alignment east side or west side of expressway?	CSU	7
64	I am a former resident of Altgeld Garden. In over 30 years Altgeld has waited to see the CTA railway realized through to the south side city limits. I support the Community Route for the Red Line because it will remove the isolation that continues to suppress opportunities for economic growth. It will also address the inequity and discrimination that has been prolonged for too long.	CSU	7,18
65	With gas prices escalating it would be feasible to use the heavy rail transit, not buses.	CSU	9
66	Since there is overcrowding already of cars on the streets use the overhead rail for the heavy rail transit.	CSU	8,9
67	At the moment, I like the State Street line which would simply be an extension of the present line. Whichever corridor is used will/should draw more commuters.	CSU	7
68	Heavy rail - Michigan, in my opinion would best serve the need of the community.	CSU	7,9
69	The corridors ending/terminating last at 130th is needed urgently. The Halsted and other corridors currently have bus access on the west and several bus routes in the center of the proposed geographic areas. In the Altgeld area there is not easy access to rail lines, southwest bus routes only the #34 services the area with limited transfer points.	CSU	7
70	The Dan Ryan (Red Line) should have been built all the way to Altgeld Gardens as originally intended. Buses constantly get jammed in 95th terminal.	CSU	4,5,19
71	The Midway (Orange Line) trains should already be going to Ford City. This was originally intended. In fact, trains have Ford City destination signs on them.	CSU	19
72	Why was the extension held from being constructed in the past?	CSU	1
73	I want to see the PRT line because it would be more accessible to and from the community. This line will also provide more jobs for the people in the surrounding community.	CSU	9
74	Please consider future multi-use trail connections - please look at Chicago Trails Plan.	CSU	16,18
75	Please be concerned about possible future gentrified communities when this extension is built.	CSU	18
76	Please be concerned about connections.	CSU	16
77	The Red Line Extension is more than 30 years coming. It should be looked at before younger projects. More ridership will come from the Red Line Extension. Over crowding at 95th Street will be taken care of, and the community will have easy access. The UP Rail Road or the Community Route is the best route to take.	CSU	1,4,7,18
78	I'd rather prefer having the Red Line use the Bishop Ford where it was proposed before. This would be closer to be at the CTA 103rd garage.	CSU	7
79	What are chances that the CTA sub-regional study will supersede the Red Line Extension project?	CSU	3
80	What is the relationship of the CTA sub-regional study to the New Starts Baseline Alternative?	CSU	3

CHICAGO TRANSIT AUTHORITY
Red Line Extension Alternatives Analysis Study
Screen One Public Involvement * Public Comments and Questions
November 21, 2007

No.	Comment/Question	Received Via*	Topic Area(s)
81	Given that PB did a feasibility study for CDOT that came to most of the conclusions we've heard tonight, what is new in this AA?	CSU	1
82	Why isn't the actual analysis with measures, methodologies, criteria being made available to the public?	CSU	13
83	Metra Line at 95th - will it connect to Red Line? And years from now after 130th, will it go further?	CSU	5,16
84	When will PB/CTA consider noise abatement technologies as a significant need for the Red Line Extension going through residential areas?	CSU	18
85	What is the relationship of Parsons-Brinckerhoff (PB) to CTA? How committed is PB to the CTA's strategic plan?	CSU	1
86	Who will get to bid on these contracts for CTA transportation jobs? Will ALL contract bids be done through City Council or Mayor Daley?	CSU	18
87	Does CTA have any idea right now how much this will be costing the residents of Chicago and the suburbs? Will you print it on the website?	CSU	13,14
88	How will you make continued connections from transit to bus?	CSU	15
89	What are the environmental justice impacts in the AA and why weren't they made public?	CSU	18
90	How does residential displacement factor in decisions to analyze various alternatives?	CSU	6,12
91	Do you foresee any displacement of homes in any of these plans?	CSU	12
92	If the UP Railroad alternative is used, will it run 24 hours and will the price be closer to that of Metra system cost?	CSU	11
93	Buses get hours cut. Don't use bus services when heavy rail is the answer.	CSU	9,19
94	Regardless of the corridor adopted, additional trains would need to be run. This could potential increase congestion within the downtown area and north to the Belmont switch. How do you plan on combating against this plausible congestion problem? Perhaps making the new south extension as a separate line much like Skokie Swift.	CSU	2,15
95	I live in Roseland, the buses are always crowded. Sometimes they are so crowded they pass my stop. I often have to walk to a more populated stop so the buss won't pass me by. The best route for the Red Line to take is the UP Rail Route or the Community Route.	CSU	7,19
96	How committed is the CTA to public involvement? Would CTA support the participation of community stakeholders on the Project Management Team, especially on the "Overall New Starts Criteria" team?	CSU	13
97	How can Chicago South assist in the process? We are a long existing community development organization on the Southside! 1968	CSU	13
98	If the alternatives analysis (AA) screenings are completed by early 2008, will CTA continue immediately to PE instead of waiting until December 2008 according to the CTA's original timeline?	CSU	1,4
99	Is it possible to get email copy of presentation?	CSU	13
100	In order to save money, can the rapid bus transit be made possible for the corridors listed instead of the rail?	CSU	9
101	What impact would hybrid busing bring to the community? Cost?	CSU	9
102	What is the priority among the New Starts projects? Because the Red Line serves low-to-moderate income communities - should that not place high priority on the project? Residents have fewer options, ratio of people to cars is also lower.	CSU	2,18
103	Have you considered splitting the Red Line at the end or midway in the study area like the Green Line?	CSU	7,11
104	How about advertising these public meetings at local stores?	CSU	13
105	Salem Baptist - have you talked to the reps about this project?	CSU	13
106	I am willing to volunteer to do outreach.	CSU	13
107	UP Railroad Corridor best one - could be elevated or below grade. 115th/Michigan location some Pace routes/CTAcould end at 115th/Kensington/Metra/South Shore. Parking is great.	WPL	7,16,17
108	Will parking be near the stations? 103rd -111th -115th/Michigan- maybe a Metra transfer near 119th street - 130th/Bishop Ford	WPL	10,16,17

No.	Comment/Question	Received Via*	Topic Area(s)
109	Michigan corridor is ok but could be costly - will it change the area around Roseland/West Pullman to something vibrant and bring business near area?	WPL	7,18
110	UPRR corridor - trench	WPL	7,8
111	I support the UP line in the community because this will benefit the Roseland area more efficiently.	WPL	7
112	The Red Line Community Route (UP railroad) is the best route because it will increase ridership, promote economic development, be easier to access, and best reflects the community needs and desires.	WPL	7,18
113	For this community the Red Line Extension is an issue that this will do what ever is necessary to support this project. I support the Community (UP) corridor at grade trench as a route to extend the Red Line.	WPL	7,8
114	The UP Railroad corridor is the route supported by over 39,000 citizens from 2 wards in the study area, and the only one which brings rapid transit service to the south city limits and to underserved patrons and workers in the area. It is the best and preferred route.	WPL	7,18
115	The UP Corridor route would be the best route for the community because it would alleviate congestion and allow Altgeld residents the ability to acquire jobs further north of the City.	WPL	7,18
116	The UP Corridor is the best route for the community!	WPL	7
117	Customer service on the buses overall is not good!	WPL	19
118	Too many unsavory characters, especially at 95th.	WPL	19
119	UP Corridor Route.	WPL	7
120	If you use Bus Rapid Transit or Heavy Rail, what people capacity and scheduled hours of operation are you proposing? Also, how often would they run? The current "EL" operates 24 hours, would this new transit route do the same?	WPL	9,11
121	Red Line Extension is long overdue. I would like to see project kept realistic with a corridor that will make it feasible. I am a little upset to not see a little about on I-57 due to the fact it could be built at-grade with lower cost. The line needs to be rail to stay fluid with system. I believe many people would use line especially I-57 users if adequate parking was to be and anchoring the south end. The population declines as you go east of Halsted and would be betting on an area renewing itself. I believe that would be a gamble. I believe a line would be most feasible terminating near 130th and Halsted.	WPL	4,7
122	Yes, it should be placed near the expressway.	WPL	7
123	I believe the Halsted Route would be more beneficial to the community while stopping some of the local bus services.	WPL	7,15
124	How would you combine the current rail with which ever rail you choose (heavy rail/bus rail)? Or will the whole thing change or just the extension?	WPL	15,16
125	When will construction start?	WPL	4
126	In order to massively increase regional transit ridership and comply with federal ADA, civil rights, and environmental justice statutes, RTA and CTA expansion should prioritize the Red Line Community Route and the MidCity Transitway (MCT) and eliminate Block 37, airport express, Circle Line and Pink Line projects.	WPL	2,4,18
127	There is a cemetery on Halsted from 124th to 127th, how will that work out?	WPL	7,12,18
128	130th is being rehabbed at the Altgeld Garden homes, wouldn't it be more feasible?	WPL	7
129	I am in favor of the Halsted or Michigan corridor being the choice for the Red Line expansion.	WPL	7
130	Will community residents be considered for employment opportunities with this project?	WPL	18
131	Has a "displacement percentage" of residents been evaluated or achieved?	WPL	12
132	Several years ago the 108 Halsted was cut in service. After 9 pm we only have Pace. Has there been any thought to reinstate the route for people who need transportation late night? My son is being picked up at 95th at 4 am because no bus will bring him home until later, or he leaves before the last 108 stop.	WPL	19

No.	Comment/Question	Received Via*	Topic Area(s)
133	I think you should use the I-94 Route/Metra Route but people can use the Metra unless they go all the way north to Howard on Red Line. Or use UPRR route on grade. L.V. CPS I could not find any info on website.	WPL	5,7
134	Halsted is better because there are more businesses.	WPL	7,18
135	The rail service should go on the Halsted Corridor. It doesn't make sense to have a rail service that goes along near the south rail system. They already have rail service. Halsted needs something.	WPL	7
136	Buses - Halsted Street/ rail - Michigan	WPL	7,9
137	Everything sounds really good; I especially like the fact that you will try to connect the Metra with the CTA lines. But I was wondering, during the whole construction process, will transportation be affected drastically?	WPL	15
138	How do you get a bus route's hours extended? The 111/115 should be 24 hours/7 days or 24 hours/5 days or some other combination. It needs to run longer than until midnight. Many of its riders work second shift jobs!!	WPL	19
139	At 130th at Ellis, it takes less than 5 minutes by car, 20 - 40 minutes by walking and biking but by public transportation it takes 3 buses and about a six block walk to reach where the proposed new transit is going to be built. How is CTA going to address this need for the residents of the Riverdale Community Area (54) to have bus transportation at 130tth Street.	WPL	4,19
140	What are the environmental impact study stated in regards to the selected technologies?	WPL	18
141	What source of fuel will be used to power the selected technology?	WPL	9
142	What are economic opportunities for communities of low-income that are near this development?	WPL	18
143	Why are public comments or questions from the floor not allowed, since this is a public, mandated meeting?	WPL	13
144	Has the CTA requested the City and/or State to provide the matching funds for the Red Line Extension project?	WPL	14
145	When the final alternative has been narrowed down, who gets to be involved in indicating which is the preferred route? Will the people in the community have a voice?	WPL	6,13
146	The CTA's lack of a true public comment process which allows participants to speak is fundamentally patronizing, classist, racist, and undemocratic. You must allow people to speak.	WPL	13
147	What consideration has been given to having a community person on your project management team for the Red Line Extension? Developing Communities Project (DCP) has been promoting this project a long time and has information that could prove quite valuable/could provide valuable input.	WPL	13
148	No specific questions tonight, but I represent 10 churches on the south side and they need to be aware of what's going on.	WPL	13
149	I live between three of your corridors evaluated. Will this effect my home? If yes, please explain. (Wentworth/State Street/Michigan Street)	WPL	7,12
150	A major concern is the amount of displacement of people, homes, etc. Which takes the least amount of displacement?	WPL	12
151	I am all for extending the Red Line, but how will affect homeowners who would be in the path of the final decision?	WPL	12
152	Will more minority businesses have an opportunity to build and flourish along the expected corridor?	WPL	18
153	Which of the proposed routes will require displacement? If so, how many residents, homes, businesses?	WPL	12
154	How many jobs for the community?	WPL	18
155	When will construction start? And when will jobs be available?	WPL	4,18
156	Is there a maximum amount the FTA will approve for each project?	WPL	14
157	Approximately how long after approval will the project take for completion?	WPL	4
158	Can all four projects be approved in this round and if so how will CTA prioritize the approved projects?	WPL	1,2
159	The Red Line needs to be extended and done in such a way that allows for maximum benefit of the community in terms of easy accessibility and potential for economic development. Why is it taking so long (and has it taken so long) for this to be done?	WPL	1,4,18
160	Will this thing ever be done? If so, when?	WPL	4
161	How much will this project cost?	WPL	14

No.	Comment/Question	Received Via*	Topic Area(s)
162	This meeting has been very informative; particularly in the areas of the diversity of transportation systems. Question: The research overwhelmingly indicates that it is feasible to extend the Red Line. Why is the process so long in implementing the extension of the Red Line? Our communities are fitting weary and impatient!	WPL	1,4
163	Like many other people, I would really like to know why this project is taking so long? (Around 40 years) We were told that the monies were available.	WPL	1,4,14
164	Will you have a place in your plan for the displaced persons?	WPL	12
165	What safety precautions will be in place for underground?	WPL	8,11
166	Where will the Red Line stations be along the proposed routes?	WPL	10
167	Who determines the route the Red Line Extension will take?	WPL	1,6
168	Can I get mailings of all your evaluations?	WPL	13
169	If heavy rail is used, what would be done for security purposes? I'm concerned about the overcast and concealing this creates of business and people under this elevated area, eg: 63rd Street.	WPL	8,18
170	With CTA proposing cuts what will be the hours of operation for the new transit line?	WPL	11
171	Will a percentage of the new jobs created with CTA be left open for some of the people in the community where the new line will venture?	WPL	18
172	Presidential Order 12898 detailed environmental justice principles, will CTA include this Order while making decisions about this development?	WPL	18
173	How is environmental justice issues being applied to this development of transportation?	WPL	18
174	Pastor Leroy Sanders - not present tonight, but he should be informed about the progress of this project.	WPL	13
175	What route will the train take?	USPS	7
176	How long will it take for a final decision to be made for construction to start?	USPS	4
177	God's Blessings on this project.	USPS	19
178	Why do south side commuters have to wait two to three times longer than north side commuters to receive basic service that pails in comparison. The red line extension is long overdue and must be constructed before any talk of a Skokie extension. Its not fair the south siders had to wait an additional 10 years for expressway reconstruction when the Kennedy has far less traffic. Now we are repeating this prejudice again to south side commuters of the cta.	EMAIL	1,2,18
179	I'm writing because I'm excited about the CTA finally taking the steps it needs to bring the Dan Ryan line extension to fruition and would like to be added to the Red Line Extension Project mailing list.	EMAIL	13
180	Why do south side commuters have to continually wait for transit improvements? The basic commuter services of the CTA buses and rail lines already pails in comparison from the north side to the south side . The red line extension is long overdue and must be constructed before any talk of a Skokie extension or any other north side improvements. Is not the brown and pink line renovations enough. The tearing down of the 63rd & Stony Island station was insulting, and resulted in longer commutes for anyone living east and south. It is not fair for the south side commuters to continually receive less service, the worst buses and never receive our fair share of transit improvements. When will the prejudice to south side commuters stop!!!	EMAIL	1,2,18,19
181	The South Side has become more populated than when this line was originally designed. An extension would make more passengers further south have an easier commute.	USPS	18
182	CTA needs to create a better time schedule for when a particular bus or train will arrive.	USPS	19
183	I think this addition will be a great opportunity for our community that will bring good paying jobs for the people which will improve the living conditions of our communities. I will support the expansion project by any way I can. UP Route.	HND	7
184	This extension will greatly benefit the entire city of Chicago. I rode the red line with my granddaughter from 87th to Grand to go to Navy Pier 2 days ago. It was a great ride.	HND	7

CHICAGO TRANSIT AUTHORITY
Red Line Extension Alternatives Analysis Study
Screen One Public Involvement * Public Comments and Questions
November 21, 2007

No.	Comment/Question	Received Via*	Topic Area(s)
185	I support the UP route.	HND	7
186	I want the UP Route extended to 130th St.	HND	7
187	I would like to see the UP Route extended.	HND	7
188	I want the UP route extended to 130th St.	HND	7
189	I would like to see the UP Route extended.	HND	7
190	Much need. UP Route.	HND	7
191	The UP Route.	HND	7
192	The UP Route.	HND	7
193	Please extend the Red line to 130rd. It is very much needed for transportation purpses. The UP route	HND	7
194	No questions right now. Except I want the UP Route.	HND	7
195	The UP Route.	HND	7
196	UP Route.	HND	7
197	We would love to let you know we need the UP Route	HND	7
198	I think it would be a good idea to extend the Red Line with stops on Michigan Ave. and King Drive. Also a stop if possible on State Street South.	HND	7
199	I think we should have the UP line so that the traffic on the Bishop Ford will be lessend and the people in that community will have better access to jobs.	HND	7,18
200	It would be nice to see the red line extended to 130th Street.	HND	7
201	I grew up in the Greater Roseland community. I support the UP route.	HND	7
202	Extension of the Red Line should be given highest priority for economic, financial and personal gain to the community. This has been needed for a long time. By the grace of God it shall be done.	HND	18
203	I think that it is a great idea to bring the red line to 130th street. People can get on the bus at 95th Dan Ryan and ride all the way to 130th rather than getting on several trains and buses. Ths is more convienent for individuals and families. There wil also be more jobs available.	HND	7,18
204	I think it would be a good idea for the red line to extend further south.	HND	7
205	I would like to see the red line extended out this way for the convienence of the people who live out this way. Also: this will hopefully create a few more jobs for people.	HND	7,18
206	I would like to see the Red Line Extension added to 130th St.	HND	7
207	I' asking for the Red Line to Create Job for the community	HND	18
208	This extension would be a great opportunity for our community where as it will provide the community with better transportation and provide more job opportunity. I support the UP Route.	HND	7,18
209	You act as though the considerable Metra infrastructure in this area does not exist. Within your Study Area there already exist 10 stations served by the Metra Electric Line, as well as another 2 served by the Metra Rock Island Line. Your "alternatives analysis" overlooks the obvious - and very inexpensive - remedy for the transit needs of this area, which is to turn the in-city portions of the Metra Electric line into a CTA operation. The right-of-way, tracks, and stations exist. This proposal has been nicknamed the "Grey Line".	EMAIL	5

No.	Comment/Question	Received Via*	Topic Area(s)
	One major reason for having the CTA operate the Blue Island, Kensington, and South Chicago branches of the Metra Electric as an "L" would be the ability to transfer to other routes to complete a trip. Currently, this requires paying two separate fares using incompatible fare systems. Having the CTA operate the Metra Electric city sections would resolve these issues, and also free up a large number of the CTA buses currently allocated for express bus service along the south lakefront. I think you need to seriously explain why this cheap, easy proposal cannot work, before asking the taxpayers to fund expensive and essentially duplicate facilities. There are already 12 rapid transit stations built, paid for, and in operation within the Study Area. We don't need any more - we just need to make better use of what we already have. It is incumbent on you to include this alternative in your formal Alternatives Analysis, otherwise you will have failed to consider all reasonable alternatives for meeting the very real transit needs of your Study Area. For more information, refer to the Chicago Area Transportation Study "Shared Path 2030" Regional Transportation Plan at http://www.sp2030.com/proposals/index.htm This proposal earned one of the strongest ratings of all those in Shared Path 2030, due to its combination of maximum benefit and minimum cost.

Chicago Transit Authority
Red Line Extension Alternatives Analysis Study

Screen 1 Public Involvement
Responses to Public Comments and Questions

15 July 2008

Written questions and comments regarding the Red Line Extension Alternatives Analysis Study were submitted by a variety of individuals and groups from throughout the Chicago region at the study's Screen 1 Public Meetings held on April 10 and 11, 2007. In addition, public comments and questions on Screen 1 were submitted directly to the Chicago Transit Authority (CTA) via e-mail and postal mail through May 11, 2007.

All of the questions and comments have been collected and compiled to provide a comprehensive review of the issues raised along with CTA's responses. Every question, comment, and suggestion, submitted during the public comment period has been compiled in the "Outreach Comment Database" (see separate document). Each question has been recorded verbatim and assigned a number that corresponds with the answers provided in this document, ensuring every question or comment submitted has been reviewed and answered or acknowledged. Collectively, the public comments and preferences will be considered in the evaluation of alternatives and concepts introduced through the public involvement process and may be evaluated and/or reflected in advancing alternatives as appropriate.

Many of the comments received were very similar in nature. As a result, similar comments and their responses have been grouped by topic and "General Comment" heading below to avoid duplicative responses. Questions or comments requiring individual or specific responses are also included below along with unique responses. In order to understand some terms used in the Comments and Responses, it may be necessary to review the original Screen 1 presentation materials which are posted on CTA's Web site www.transitchicago.com.

The list below shows the index of topics covered in the report, along with the number of comments received for each. Because comments often refer to more than one topic, the numbers associated with each do not equal the total number of comments received.

Index of Topics

1. FTA's Alternatives Analysis Process (15)
2. Relationship of Red Line Extension to Other Proposed Transit Projects (6)
3. Relationship of Red Line Extension Project to Far South Sub-Regional Study (2)
4. Overall Red Line Extension Project Timeline, Purpose, and Need (14)
5. Red Line Extension Study Area (10)
6. Evaluation Criteria Used in the Alternatives Analysis Study (10)
7. Alignments (Corridors) Analyzed (89)
8. Vertical Profiles Analyzed (9)
9. Transit Vehicle Technologies (Modes) Analyzed (19)
10. Proposed Red Line Extension Stations (6)
11. Proposed Red Line Extension Operations (7)
12. Potential Property Acquisition & Impacts (12)
13. Alternatives Analysis Public Involvement Process and Format (19)
14. Funding for Red Line Extension Construction and Operations (9)
15. Potential Red Line Extension Impacts on Existing CTA Services (5)
16. Potential Red Line Extension Connections with Existing Regional Transit Services (11)
17. Potential Red Line Extension Parking Facilities (5)
18. Potential Red Line Extension Economic and Environmental Impacts (39)
19. General Customer Service Questions/Compliments/Complaints (14)

1.

FTA's Alternatives Analysis Process

General Comment:

Please Describe the Federal Transit Administration's (FTA) Alternatives Analysis process and its components.

Pertains to specific comments:

9, 38, 54, 72, 77, 98, 158, 159, 162, 163, 167, 178, 180

Response to Overall Category Comment:

Alternatives Analysis has for over 25 years been a key part of FTA's decision-making process for awarding grant funding to support fixed guideway transit projects. Federal law requires that projects seeking grant funding from FTA's New Starts program be based upon the results of an alternatives analysis study and subsequent preliminary engineering. Alternatives analysis has also been a part of established transportation planning practice in the United States for several decades. At its core, alternatives analysis is about supporting local decision-making. An effective alternatives analysis answers the questions: What are the transportation problems in a corridor? What are their underlying causes? What are viable options for addressing these problems? What are their costs? What are their benefits?[1]

The Red Line Extension project is currently conducting its Alternatives Analysis study. The Red Line Extension Alternatives Analysis study will have three steps or "screens." Screen 1, which has just been completed and presented to the public, has issued preliminary findings regarding corridors, alignments, and vehicle technologies that should be advanced to Screen 2 for further analysis. These findings have determined 3 vehicle technologies, 3 potential corridors and 3 alignments that should be studied further. Screens 2 and 3 will further refine these corridors, technologies and alignments. In each successive screen, the potential locations, vehicles and alignments will be discussed in more detail, costs and ridership will be projected and operational questions considered. Ultimately, this process will result in the selection of a Locally Preferred Alternative (LPA) which, with FTA approval, will subsequently undergo environmental analysis and preliminary engineering.

A detailed description of the formal FTA Alternatives Analysis process is available at the Federal Transit Administration's web site: http://www.fta.dot.gov/16363_ENG_HTML.htm .

Other Specific Comments Noted on this Topic:

Comment:

81: Given that PB did a feasibility study for CDOT that came to most of the conclusions we've heard tonight, what is new in this AA?

Response:

The feasibility study that was conducted for CDOT served as a starting point to build the "Universe of Alternatives" for the Red Line Extension's Alternatives Analysis. The results presented in Screen 1 represent a shortlist of alternatives that merit further consideration in the alternatives analysis study. In subsequent screens, increasingly rigorous evaluation criteria will be applied to the remaining alternatives with the objective of identifying a Locally Preferred Alternative. Unlike a feasibility study, a formal alternatives analysis (AA) must follow guidelines as prescribed by the Federal Transit Administration. The AA considers additional transit alternatives not considered during the feasibility study introduces public involvement in the planning process and represents the first formal step in the application for New Starts funding.

Comment:

85: What is the relationship of Parsons-Brinkerhoff (PB) to CTA? How committed is PB to the CTA's strategic plan?

---

[1] "Additional Guidance on Local Initiation of Alternatives Analysis Planning Studies." Federal Transit Authority Web site.

Response:

PB is a paid consultant to the CTA, performing the technical services for the Red Line Extension Alternatives Analysis. CTA relies on transportation consultants like PB to assist in the completion of project analysis and deliverables for special projects for which it is more cost effective to contract for the necessary expertise for limited time rather than adding to CTA planning staff. PB is a widely recognized consulting firm that participated in a competitive bidding process against other consulting companies to assist the CTA with the completion of the Red Line Extension Alternatives Analysis. The CTA awarded the contract to PB due to their technical skills and extensive experience performing similar work. The project team assisting with the Red Line Extension is local to Chicago and familiar with the city, the study area and its related transportation needs. CTA has oversight on all work completed by PB and the CTA and PB are partners in the Red Line Extension Alternatives Analysis; both parties are committed to the goals and success of the project.

2. Relationship of Red Line Extension to Other Proposed Transit Projects

General Comment:

Are other transit projects being considered by CTA, and if so, what is the relationship between the Red Line Extension and these other projects?

Pertains to specific comments:

94, 102, 126, 158, 178, 180

Response:

Every five to six years, the United States Congress enacts legislation that authorizes federal funding for highway, transit, motor carrier, safety, and research programs across the country. This federal support represents the primary source of capital funding for CTA and other transit agencies throughout the U.S. The current legislation, known as SAFETEA-LU (Safe, Accountable, Flexible, Efficient Transportation Equity Act - A Legacy for Users), authorizes the federal transit and highway programs through 2009. President Bush signed the act into law on August 10, 2005.

The SAFETEA-LU legislation authorized CTA to seek federal New Starts grant support for five new rail lines or line extensions including: the Red Line Extension to 130th Street; the Orange Line Extension to Ford City; the Yellow Line Extension to Old Orchard; the Circle Line; and the Ogden-Carroll-Navy Pier Transitway. In order to qualify for New Starts funding, CTA is required to perform comprehensive Alternatives Analysis studies for each. Alternatives Analysis studies for all five projects are currently underway following the same federally mandated process as the Red Line Extension study, but addressing the unique transportation needs of their respective study areas.

A key objective of the Federal Transit Administration's Alternatives Analysis process is to measure all transit projects from across the nation by the same set of standards. This process ranks projects based on this measurement and not on where they are located. In this way, the benefits and costs of a project can be objectively measured in comparison to all others. Acknowledging that each project has a unique Purpose and Need, the process allows multiple projects from the same region to be rated highly. It is not unusual for a large region such as Chicago to seek approval for several major transit initiatives at the same time. In the late 1990s, CTA won New Starts funding approval for both the Cermak (Douglas) Branch reconstruction and the Brown Line capacity expansion project at the same time. Metra has also received New Starts funding for multiple projects at the same time. New York City in 2005 had two multi-billion dollar transit projects approved for New Starts funding.

In order to qualify for federal funding, regional transportation projects must also be included in an official Regional Transportation Plan. Chicago's Regional Transportation Plan is prepared by the Chicago Metropolitan Agency for Planning[2] (CMAP) with input from local and state government agencies

---

[2] CMAP was created in 2006 by the merger of the Chicago Area Transportation Study (CATS) and the Northeastern Illinois Planning Commission (NIPC).

(including CTA), community organizations, and the general public. The plan is updated regularly and the Red Line Extension project is included in the plan. The most recent comprehensive update of the 2030 Regional Transportation Plan (RTP) was prepared in 2006 and involved extensive public outreach meetings throughout the region in May and June of 2006. A technical update of the 2030 RTP was also completed earlier this year. Additional information on this plan can be found on CMAP's "Shared Path 2030" Web site www.sp2030.com.

3. Relationship between Far South Sub-Regional Study and Red Line Extension Project

General Comment:

We have questions relating to the Far South Sub-Regional Study and its impact to the Red Line Extension Project.

Pertains to specific comments:

79, 80

Response to Overall Category Comment:

CTA's Far South Sub-regional Study seeks to better meet transportation needs in a relatively short timeframe (approximately one to two years) through potential restructuring of existing bus routes and/or creation of new bus services. Guided by comments voiced by the local communities, the objective of the sub-regional study is to implement solutions that can address transit needs in a shorter time frame. The Red Line Extension project not only examines existing conditions, but it also accounts for what is anticipated to be problems over a longer planning horizon, out to year 2030. As a result, the scope of the Red Line Extension project is focused on a more permanent long-term solution that can not only solve the study area's current day problems, but can mitigate growing transportation problems projected for future years.

4. Overall Red Line Extension Project Schedule and Timeline, Purpose and Need

General Comment:

What is the timeline of the project? How long will it take from design until operation?

Pertains to specific comments:

70, 77, 98, 121, 125, 126, 139, 155, 157, 159, 160, 162, 163, 176

Response to Overall Category Comment:

The FTA New Start grant program requires conceptual transit project proposals to proceed through a formal process of planning, design, and construction. Upon completion of this process, the project is ready for operation. The process involves five formal steps: Alternatives Analysis (AA); Environmental Impact Statement (EIS); Preliminary Engineering (PE); Final Design (FD); and Construction. Each of these steps typically takes 2-3 years to complete. Initiation of each step is also contingent upon continued availability of federal and local funding, the timing of which will also affect the overall project schedule. For highly complex projects the Final Design and Construction steps take longer, particularly if construction is implemented in sequential phases rather than all at once.

In the Alternatives Analysis step, the project's purpose and need is identified, alternatives to address the purpose and need are developed and evaluated, comprehensive and on-going public involvement is initiated, and a Locally Preferred Alternative (LPA) is determined. The Red Line Extension project's "purpose and need" is to improve transportation access and enhance opportunity for economic development within the study area. In particular, transportation improvements are needed to reduce the significant bus and passenger congestion at CTA's existing 95th Street Red Line station; reduce lengthy bus trip times to access the 95th Street Red Line station from neighborhoods south of 95th Street; reduce the lengthy transit commute times experienced by many residents of the study area; and more effectively manage future traffic growth in the study area. Extending Red Line transit service south of 95th Street is intended to stimulate economic development and enhance job opportunities by improving access to, within, and beyond the study area and shortening transit travel times through faster and more direct transit service.

The Red Line Extension project is currently in the Alternatives Analysis phase. The next step is preparation of an Environmental Impact Statement (EIS). In this step, potential environmental, financial and economic impacts of each alternative are identified, potential environmental impacts of the LPA are analyzed; environmental mitigation strategies are developed, public hearings are conducted to receive input, and a formal Record of Decision is received from the FTA upon successful completion. The Preliminary Engineering step involves engineering effort to support the EIS (30% design level), development of project phasing and construction staging, and feasibility review of mitigation approaches for construction or operational impacts. In the Final Design step the engineering design started in PE is completed, capital and operating cost estimates are updated and construction drawings are prepared, and a Full Funding Grant Agreement is obtained from the FTA upon successful completion. The Construction step commences when federal and local matching funds are secured.

The current Red Line Extension Alternatives Analysis study is expected to conduct public involvement meetings for Screens 2 and 3 in 2008. Identification of an LPA and completion of the study is anticipated in 2008.

5. Red Line Extension Study Area

General Comments:

How large is the project study area? How were the boundaries of the study area determined?

Pertains to specific comments:

9, 58, 70, 83, 133

Response to Overall Category Comment:

A key component of the Alternatives Analysis process is specifying a study area of a definite size for the project. The goal is to establish a specific area and to define the transit challenges and opportunities within this particular space, so that potential solutions can be measured against these defined challenges. Keeping the study area focused also helps to avoid confusion between multiple unique transit project proposals within the same city or region. Too large a study area can make it too difficult to determine accurately whether the potential solutions effectively address the identified transportation needs.

The Red Line Extension study area is bounded by the current terminus of the existing CTA Red Line at 95th Street (9500S) on the north, the Little Calumet River (approximately 13000S) on the south, Ashland Avenue (1600W) on the west, and Stony Island Avenue (1600E) on the east. The study area is four (4) miles east-to-west and approximately five (5) miles north-to-south. These boundaries define an area with numerous opportunities for improving transit connections and growing transit market share. A key goal of the Red Line Extension is to improve transportation access and enhance opportunities for economic development. In particular, transportation improvements are needed to reduce the significant bus and passenger congestion at CTA's existing 95th Street Red Line station; reduce lengthy bus trip times to access the 95th Street Red Line station from neighborhoods south of 95th Street; reduce the lengthy transit commute times experienced by many residents of the study area; and more effectively manage future traffic growth in the study area. Extending Red Line transit service south of 95th Street is intended to stimulate economic development and enhance job opportunities by improving access and shortening transit travel times through faster and more direct transit service. The study area boundaries encompass the areas that would benefit most directly from such transit service improvements.

For more information on the details of the study area population, please see the Screen 1 report document, which is available for download at the CTA's website www.chicagotransit.com as noted in the introduction to this document.

Other Specific Comments Noted on this Topic:

Comment:

We have questions relating to the "Gray Line" proposal and its consideration in this Alternatives Analysis.

Pertains to specific comments:

55, 56, 57, 209

Response:

The "Gray Line" proposal calls for operational changes to increase service frequency on the Metra Electric District Line and improve CTA connections to this facility as well as fare integration between regional transit services.

Opportunities for changes or improvements to the existing Metra commuter rail service and CTA bus services within the corridor will be evaluated in detail during both the Screen 2 and 3 processes. These types of "lower capital cost investment" opportunities will be considered within the no-build and TSM alternatives described in Topic 6, as well as in conjunction and coordination with other more capital intensive options. Additionally, CTA is focusing attention on identifying possibilities to enhance intermodal interchange on the various alignments. See Topic 16 for additional information about connections with existing regional transit services.

A proposed "Gray Line" meets some of the needs of the study area, such as reducing the lengthy transit commute times experienced by many residents of the study area. However, it will not be included as a build alternative in the current Alternatives Analysis because it does not comprehensively address all of the needs of the project, including alleviating the bus and passenger congestion at 95th Street Red Line station, reducing travel times of passengers that transfer from bus to CTA rail to best access their destination, or stimulating economic development in the region. Additionally, as noted in Topic 9, commuter rail has several characteristics that are less favorable for the study area than other modes analyzed (such as bus and heavy rail).

Comment:

7: If extended again, will this line serve the Gary Airport and extend onto South Bend, Indiana?

Response:

The scope of this Alternatives Analysis study is strictly tied to the project's purpose and need (see Topic Area 4) and the project's defined study area (above). While consideration can be made to preserve other future opportunities for expansion, any initiative to further expand service to Gary Airport and South Bend, Indiana would merit further investigation and its own planning study.

6. Evaluation Criteria Used in the Alternatives Analysis Study

General Comment:

How are screening criteria applied throughout the analysis to advance the alternatives being evaluated?

Pertains to specific comments:

18, 38, 48, 53, 54, 61, 90, 145, 167

Response to Overall Category Comment:

A three phase evaluation methodology is being used for the Red Line Extension Alternatives Analysis. With each screen increasingly detailed and comprehensive evaluation criteria are applied to a decreasing number of alignment alternatives that have been identified as the best potential transportation investments. Each step in the evaluation process is thus designed to increase the level of detailed planning and engineering analysis on progressively fewer alternatives.

In Screen 1, the Alternatives Analysis began with identifying a "universe" of alternatives—all of the conceivable transit service improvements that may address the purpose and need for the project within the study area. These alternatives included a wide array of transit vehicle technologies, six potential corridors through the study area, and three possibilities for vertical profiles (above ground, below ground, and at ground level). This universe of alternatives was evaluated in Screen 1 to identify a shortlist of specific technologies, corridors, and profiles that may best satisfy the project's goals and objectives.

In Screen 1, the transit vehicle technologies were evaluated for study area suitability according to the length of commute, typical station spacing, operating speed and system applicability. Simultaneously, the corridors through the study area were evaluated according to social factors (land use, neighborhoods and communities, and population access) and transportation factors (system usage and accessibility). Next, in combination with possible vertical profiles (subway, trench, at-grade, or elevated), the corridors and technologies that were found to be suitable to the study area were then evaluated according to general environmental, transportation, and economic parameters. These general evaluation criteria were used to eliminate alternatives that were not capable of meeting the project's goals.

For more information on the Screen 1 evaluation criteria or evaluation results of each alternative, please see the detailed summaries available for review on the Screen 1 presentation boards, which are available for download at the CTA's website www.chicagotransit.com as noted in the introduction to this document.

Other Specific Comments Noted on this Topic:

Comment:

3: Would like more information on no-build and baseline?

Response:

The No-Build Alternative incorporates only those transportation improvements that are included in the 2030 Regional Transportation Plan for which need, commitment, financing, and public and political support are identified and are reasonably expected to be implemented. The second alternative that is developed for consideration is called the Transportation System Management (TSM) Alternative and is defined as the best that can be done for improving mobility without constructing a new transit guideway. The TSM Alternative can include applicable transportation system upgrades such as intersection improvements, bus route restructuring, shortened bus headways, express and limited-stop service, signalization improvements, and timed-transfer operations.

The Federal Transit Administration must approve the definition of the No-Build and TSM Alternatives; however, only one of these alternatives advances as the Baseline Alternative. Because the Baseline Alternative should represents the best that can be done to improve transit service in the study area without major capital investment in new infrastructure, it is often the TSM Alternative that is used as the Baseline Alternative. The Baseline Alternative should be designed to address identified transportation needs in the Red Line Extension study area and demonstrate the extent to which these problems can be solved without a proposed major capital investment.

The definitions and selection of the No-Build and TSM Alternatives – and the alternative chosen as the Baseline Alternative – occur in the next stage of the project, Screen 2. At that time, definition of the specifics of these alternatives will be presented to the public in one of the future project public forums. Additionally, measured benefits from the alignment, mode and vertical profile alternatives (or build alternatives) that have advanced to Screen 2 will be compared with the FTA-required Baseline Alternative. This comparative analysis is a key activity that the FTA uses in their annual rating of New Starts transit projects.

7. Alignments (Corridors) Analyzed

General Comment for UPRR Corridor:

There is a strong level of support within the community for extending CTA Red Line service along the Union Pacific Railway corridor.

Pertains to specific comments:

1, 4, 15, 16, 17, 24, 25, 26, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 44, 45, 64, 69, 77, 95, 107, 110, 111, 112, 113, 114, 115, 116, 119, 183, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 200, 201, 203, 206, 208

General Comment for Michigan Avenue / Halsted Street Corridors:

There is support within the community for extending CTA Red Line service along the Michigan Avenue and/or Halsted Street corridors.

Pertains to specific comments:

41, 46, 68, 109, 123, 129, 134, 135, 136, 198

General Comment for Various Corridors Analyzed:

There is support for other corridors and/or please provide clarification on the various corridors considered.

Pertains to specific comments:

8, 14, 22, 43, 48, 53, 60, 62, 63, 67, 78, 103, 121, 122, 127, 128, 133, 149, 175, 184, 199, 204, 205

Response to Overall Category Comment:

Several recommendations and preferences for potential alignment extensions were provided on the question/comment cards submitted by the public. Many are derivations of the alternatives already defined. Others significantly differ from the alternatives proposed by the CTA. Staff will review all suggestions and incorporate in the analysis those that offer merit for further consideration. Suggested alignments that are predominantly or entirely outside the defined study area will not be considered.

Regarding the defined alternatives, nine (9) different north/south corridors were defined and reviewed as part of the universe of alternatives. Collectively, these alternatives encompass the entire study area. From west-to-east across the study area alternatives include: 1) I-57 Expressway Corridor that, similar to the existing Red Line would be an extension of the rapid transit service in the median of the expressway. 2) The next corridor is Halsted, one of the major north/south arterial streets in the study area. Halsted is a wide street with four lanes of traffic, parking and a median. The corridor attracts a large amount of activity and includes a concentration of retail stores. Several local bus routes currently use Halsted. 3) The Union Pacific (UP) Railroad corridor is the freight railroad corridor and then continues south-east parallel to the Bishop-Ford/130th Street area. This alternative would serve the center of the study area and then shift to the southeast. 4)Wentworth is predominantly a residential street, that narrows significantly towards the south. 5) The State Street alternative is also a narrow street that is mostly residential. The latter two alternatives are not currently served by bus service.

Continuing to the east is: 6) Michigan Avenue, which is a major commercial corridor through the heart of the study area with several local bus services operating on it; towards the south end (south of 120th) the land use becomes residential. 7) King Drive is the next corridor to the east. King Drive has bus service over a portion of it, and much of the surrounding land use is residential; the street ends at 115th Street. 8) Cottage Grove/Metra Electric alternative would extend east along 95th Street and then generally operate parallel to the Metra Electric service (along Cottage Grove) and then head to the southeast, adjacent to the South Shore Line, ending in the vicinity of the Bishop Ford and 130th Street. The ninth (9) and last corridor is the I-94 - Bishop Ford alternative. This corridor has been studied previously and would use the expressway median from 95th Street and continue down I-94. This is a low density non-residential corridor over the majority of its length.

Other Specific Comments on this Topic:

Comment:

42. Why don't you reconsider taking the Red Line Extension down the Bishop Ford Expressway and reroute buses into station?

Response:

The ninth alternative considered does propose use of the Bishop Ford expressway median from 95th street to 130th Street. Optimizing existing, and potentially expanding, transit service, including feeder bus and suburban bus services, are important considerations in developing this and other alternatives being studied. One concern with this alternative is that it is somewhat removed from the population centers in the study area. While it is true that feeder buses could link the population centers to the new stations, travel time reductions from reduced transfer activity is a key purpose of this extension. All of these factors will be considered in greater detail as the Alternatives Analysis advances.

8. Vertical Profiles Analyzed

General Comment:

Please provide additional information on the issues involved with elevated, at-grade, trench and underground alignments.

Pertains to specific comments:

27, 41, 66, 110, 113, 165, 169

Response to Overall Category Comment:

Four alignments (or profiles) are possible for any transit service: below ground (subway), open cut (trench), above ground (elevated), or at-grade (street level). The current CTA system features trains that operate on each of the four alignments at various points within the rail system. Following modern transit industry practice, CTA-compatible heavy rail will only be considered in elevated, trench, or below ground alignments in the Red Line Extension analysis (not at street level).[3] Bus rapid transit will only be considered on street level, because the benefits of lower construction costs could not be realized if it used an elevated structure or subway alignment like heavy rail.

In Screen 1, vertical profiles for corridors and transit technologies (rail, bus, etc.) were evaluated according to general environmental, transportation, and economic parameters. These general evaluation criteria were used to eliminate alternatives that were not capable of meeting the project's goals. See Topic Area 6 for more information. Preferences for potential vertical profiles that were provided on the question/comment cards submitted by the public will be reviewed by staff and profiles that offer merit will be incorporated into the analysis for further consideration.

Other Specific Comments on this Topic:

Comment:

23. The UP option looks good. Would the CTA build an elevated line beside the tracks, as they did with the Orange Line, or is the UP line abandoned and they could simply build on the embankment?

Response:

For the Red Line Extension Alternative Analysis, elevated and trench rail profiles are being considered for the UP corridor alternative.

The UP Line is an active rail line and is an important corridor linking Chicago and the south. This freight line is at-grade from the north end of the study area to State Street (south of 115th) and then elevated through the center of Roseland. It returns to an at-grade alignment after crossing over the Metra Electric/Canadian National rail lines around 119th Street. The UP Line is also being evaluated by Metra as a possible commuter rail route for the South-East Service, which is in its own Alternatives Analysis planning process. CTA will coordinate with both Metra and UP to accommodate the existing freight line and any potential transit improvements.

---

[3] Although there are section of CTA's Brown, Pink, and Purple heavy rail transit lines that currently operate at-grade, this characteristic is due to the design standards that were in place at the time these lines were built nearly 100 years ago. Modern design practice for newly-built heavy rail transit lines calls for complete grade separation to promote faster, safer, and more reliable service for transit customers.

Comment:

59. Are you considering elevated trains for the Halsted and Michigan models?

Response:

In the case of the Halsted and Michigan alignments, both subway and elevated rail profiles continue to be analyzed.

9. Transit Vehicle Technologies (Modes) Analyzed

General Comment for Heavy Rail Rapid Transit:

There is support within the community for Heavy Rail Rapid Transit.

Pertains to Specific Comments:

1, 16, 24, 27, 41, 61, 65, 66, 68, 93

General Comment for Various Transit Vehicle Technologies Analyzed:

There is support for other vehicle technologies and/or please provide clarification on the various modes considered.

Pertains to specific comments:

44, 73, 120, 136

Response to Overall Category Comment:

Several recommendations and preferences for modes were provided on the question/comment cards submitted by the public. Staff will review all suggestions and incorporate in the analysis those that offer merit for further consideration.

During Phase 1, eleven (11) transit technologies were evaluated applying a series of screening factors including vehicle operating speed, station spacing requirements, capacity, reliability, and daily use in revenue transit operations. Preliminary findings for Screen 1 identified two technologies to advance to more detailed evaluation -- Bus Rapid Transit, or BRT, and Heavy Rail Transit, or HRT -- the existing type of Red Line technology -- to be carried forward. The other nine technologies were deemed not as well suited to this study area due to factors like the operating speed and other compatibility issues. Bus Rapid Transit will be considered only as an at-grade application or in-street operation. For Heavy Rail Transit, three different options in terms of profile will be considered including; elevated, in-trench and underground (or subway). HRT and BRT technologies will now be evaluated within the operating context of the alternatives being carried forward.

Other Specific Comments on this Topic:

Comments:

49. Why was commuter rail rejected?
50. Why was a viable commuter rail alternative rejected?

Response:

In Screen 1, the transit vehicle technologies were evaluated for study area suitability according to the length of commute, typical station spacing, operating speed and system applicability. Commuter rail has several characteristics that are less favorable for the study area than other modes analyzed (such as bus and heavy rail). Commuter rail is typically used for longer distance trips, such as from the suburbs to the central city, and station spacing is usually three to seven miles apart. Meanwhile, the study area for the Red Line Extension is four (4) miles east-to-west and approximately five (5) miles north-to-south. Preferred modes in the study area would need to have closely spaced stations to facilitate trip making both within and beyond the study area. Additionally, the frequency of service required to effectively serve short distance trips anticipated in this study area is not conducive to commuter rail. Commuter rail service tends to be oriented toward peak period travel; in contrast, the technology selected to serve the study area demand would be intended for operation seven days per week and up to 24-hours per day.

Comment:

100. In order to save money, can the rapid bus transit be made possible for the corridors listed instead of rail?

Response:

Bus Rapid Transit (BRT) along with Heavy Rail Transit (HRT) are the two technologies that based upon the analysis will be brought forward into the next planning and evaluation phase. While BRT can utilize separate lanes, station construction, special signalization, and other infrastructure, BRT within this study will be confined to at-grade (or in-street) operations. This reduces the infrastructure requirements -- and costs -- often associated with BRT as confirmed by several of the BRT services in operation throughout the U.S. The planning process is not yet in an advanced stage that would support any statement regarding capital or operating costs.

Screen 1 findings recommend BRT alternatives to operate on Halsted and Michigan at-grade. Heavy rail is recommended to be carried forward to further evaluate its operation along the Halsted and Michigan Avenue corridors in either subway or elevated. For the UP Railroad, operating along an elevated right-of-way or in trench will be considered. Many factors in addition to cost will be evaluated in the consideration and eventual selection of the mode best suited for the projected level of ridership, including the appropriateness for the corridor, environmental compatibility, traffic impacts, safety, and visual impacts. Positive impacts will be identified as well, such as the anticipated positive impacts on community and commercial development and expanded employment opportunity.

Comments:

101. What impact would hybrid busing bring to the community? Cost?
141. What source of fuel will be used to power the selected technology?

Response:

The planning process has not yet advanced to a stage that would support any statement regarding the impacts of various propulsion system alternatives.

10. Proposed Red Line Extension Stations

General Comment:

Where would stations on the proposed Red Line Extension be located?

Pertains to Specific Comments:

3, 19, 26, 61, 108, 166

Response to Overall Category Comment:

Prospective station locations for advancing BRT and HRT alternatives will be reviewed as part of Screen 2.

Physical constraints, the ability to transfer between lines, cost, property acquisition and other critical station design issues will all be addressed in the preparation of the federally required Environmental Impact Statement (EIS). The EIS process is a requirement for federal funding and mandates that any negative environmental impacts—including impacts upon the built environment—must be mitigated in order to receive federal approval. The EIS process begins after the Alternatives Analysis process ends and an LPA is determined.

11. Proposed Red Line Extension Operations

General Comment:

How will the service operate? Will the trains run 24 hours and what will be the fare?

Pertains to Specific Comments:

15, 46, 92, 103, 120, 165, 170

Response to Overall Category Comment:

At this time, specific operating hours, fares, and other operational issues of the Red Line Extension have not been determined. As a part of Screen 3, FTA guidance requires CTA to conduct additional analysis of ridership, travel times, and cost-effectiveness ratings (cost per travel time savings) on the proposed routes and transit technologies. Until these additional reviews have been made, operating recommendations will not be developed. It is expected, however, that any new CTA service will be generally consistent with current CTA operating practices and seek to provide customers with safe, frequent and reliable travel options. Any new CTA service and associated facilities recommended by this study would be consistent with the Americans with Disabilities Act (ADA) requirements.

12. Potential Property Acquisition and Impacts

General Comment:

Alternatives with less residential displacement are preferred. How will you handle displaced residents due to property acquisition?

Pertains to Specific Comments:

4, 18, 24, 90, 91, 127, 131, 149, 150, 151, 153, 164

Response to Overall Category Comment:

At this early stage in the Alternatives Analysis study CTA cannot determine how much private property, if any, would need to be acquired in order to construct and operate the selected alternative. A final determination on the vehicle technology, alignment and vertical profile will need to be established before potential property impacts can be assessed. Potential property impacts are determined in detail as a part of the Preliminary Engineering (PE) phase of project development, which proceeds concurrently with the preparation of the Environmental Impact Statement (EIS). The EIS process is a requirement for federal funding and mandates that any negative environmental impacts—including impacts upon private property—must be mitigated in order to receive federal approval. The EIS and PE processes both begin after the Alternatives Analysis process ends and an LPA is determined. Public acquisition of private property is governed by federal and local laws. In accordance with these laws, affected property owners would be compensated for their properties based on fair market values and can be provided relocation costs. See Topic 18 for additional details about potential economic and environmental impacts of the Red Line Extension project.

13. Alternatives Analysis Public Involvement Process and Format

General Comment:

Does the public involvement process for the Red Line Extension Alternatives Analysis study allow individuals to have a voice in the decision in the corridor selection? Is all the information (evaluation criteria, etc.) available to the public?

Pertains to Specific Comments:

5, 54, 82, 87, 96, 97, 99, 104, 105, 106, 143, 145, 146, 147, 148, 168, 174, 179

Response to Overall Category Comment:

Public involvement is a key component of this process. The outreach has already begun including a community stakeholders meeting with representatives and leaders of various community groups throughout the study area. We also have met with all the elected officials and reached out to all the aldermen representing the Red Line Extension study area and adjacent areas. Many of the state representatives and senators from the area have been given a briefing on this presentation. Meetings also included faith- based organizations, other community organizations, and city and state agencies such as the Chicago Department of Transportation, Illinois Department of Transportation, Regional Transportation Authority, Metra, and Pace. If your organization would like to be included in the stakeholder's meetings please contact Darud Akbar, CTA Government and Community Relations at dakbar@transitchicago.com.

The public involvement process for the Red Line Extension Alternatives Analysis study also includes a total of six public involvement meetings, two each at the conclusion of the Screen 1, Screen 2, and Screen 3/LPA analyses. The Screen 1 meetings were held at Chicago State University and West Pullman Public Library. Meeting locations for Screen 2 and Screen 3 have not yet been determined nor have the dates. The meeting locations must be close to public transit and accessible to people with disabilities. Suggestions for meeting locations may be sent to Darud Akbar, CTA Government and Community Relations at dakbar@transitchicago.com.

Meetings are announced through ads in neighborhood newspapers and publications as well as public alerts on CTA trains and buses, at rail stations, on the CTA Web site, and distributed to print and broadcast media via news releases.

The format of the meetings included groups of presentation boards containing detailed information on each area of analysis in the study, where individual conversations between the public and project staff knowledgeable about that area of analysis could take place. The public meetings also included a community presentation that provided information in a slideshow format led by the study's project managers (available at www.transitchicago.com). Meeting attendees were requested to submit questions and comments in a written format. CTA's goal in emphasizing written questions and comments has been to ensure everyone's thoughts are collected and reviewed, rather than only those individuals who might choose to speak publicly at a meeting or monopolize available time thus precluding others from voicing their questions and comments. The intent has been for everyone to have an equal opportunity to participate in the process. In addition, by reviewing and responding to similarly worded questions, the presenters efficiently addressed multiple individuals at once and avoided repetition during the public meetings. CTA and the consultant team staff have also been available to answer any individual questions on a one-on-one basis following the general question and answer period at each meeting.

The written comments received at the public meetings and other detailed comments submitted subsequently are being answered individually for the record in the format of this document, which will be made available publicly on the CTA Web site, by email to public meeting participants, and in hard copy by written request. All of the comment cards and other written communications (primarily emails) will collectively become part of the evaluation process and will be submitted to the Federal Transit Administration as a part of the official documentation for the Alternatives Analysis study.

Other Specific Comments on this Topic:

Comment:

10. Will representatives come out to groups to provide a presentation?

Response:

Presentations can be scheduled by contacting Darud Akbar, CTA Government and Community Relations at dakbar@transitchicago.com.

14. Funding of Red Line Extension Construction and Operations

General Comment:

How will the construction and operation of the Red Line Extension be funded? How much funding for this project has already been received by CTA? How much with the project cost?

Pertains to Specific Comments:

12, 13, 53, 87, 144, 156, 161, 163

Response:

The Red Line Extension will seek approval and funding for construction from the federal government through the Federal Transit Administration's "New Starts" grant program. This program provides funding for major public transit infrastructure projects throughout the U.S. For projects that ultimately receive a "Full Funding Grant Agreement," the federal government typically provides 50% or more of the project's capital costs. State and local funds comprise the remainder. Other sources may also be used to provide funding for the project, but the federal New Starts grant program is the program most capable of supporting transit projects of this nature. Securing a New Starts grant requires the project to be evaluated as part of a nationally competitive process.

To secure the federal New Starts funding, matching funds of at least 20% are required from non-federal (i.e., state and local) sources. From 2000 through 2004, the Chicago region's matching funds came from the State of Illinois through the Illinois FIRST legislation. The Illinois FIRST legislation expired on June 30, 2004. Since that time, CTA has been working with the Illinois Legislature to enact a replacement to Illinois FIRST and ensure that all future federal transit funds available to the Chicago region can be utilized.

Estimates of the Red Line Extension capital costs will depend on route and alignment and will be prepared during the second and third analysis phases, or Screens. Once the line is built and operational, the funds to operate the system will come from fare revenue as well as local and state funding sources, consistent with the funding mechanisms that support CTA's current bus and rail transit services.

At the present time, CTA only has sufficient funding to initiate this Alternatives Analysis study; it has received no federal funding for completing the remaining steps involved in planning, designing, and constructing the Red Line Extension project. Although the project was listed as "eligible" to receive federal funding in the SAFETEA-LU legislation of 2005 (see Topic 4), no funding for environmental analysis, preliminary engineering, final design, or construction of this project has been appropriated by the U.S. Congress (nor the Illinois State Legislature) at this time.

Other Specific Comments on this Topic:

Comment:

11. If non-federal funds were used, would this project move faster?

Response:

It is possible to build a major transit improvement such as the Red Line Extension without using any federal funding. Due to the high cost of this type of project and the limited availability of non-federal (i.e., state and local) funds seeking federal support is desirable. If sufficient state and local funds were identified so that no federal funding would be needed, there may be some time savings from avoiding federal requirements. This time savings may be limited – the project development process would still include similar steps. The Alternatives Analysis step remains a prudent planning process to ensure that the proposed public investment is best suited to addressing the identified purpose and need. Environmental studies will still be required per state and local laws, and the duration of design and construction steps would not change significantly due to a change in funding sources.

15. Potential Red Line Extension Impacts on Existing CTA Services

General Comment:

How would the Red Line Extension impact current CTA services, both during construction of the new service and ultimately during operation of the new service?

Pertains to specific comments:

88, 94, 123, 124, 137

Response to Overall Category Comment:

While the specifics of construction staging and the exact route of the Red Line Extension have not yet been established, a general guideline is that impacts to existing transit services must be minimized during construction. Bus reroutes are possible on paralleling streets through much of the study area.

The structure of existing bus routes in the study area may be changed to complement new high-capacity transit service. Depending on the specific route of the high-capacity service, the number of routes feeding into the 95th Street Red Line station may be reduced, which would reduce congestion in and around this facility.

16. Potential Red Line Extension Connections with Existing Regional Transit Services

General Comment:

Will the Red Line Extension connect with existing CTA and Metra lines? Will I be able to transfer from one service to another?

Pertains to specific comments:

20, 58, 74, 76, 83, 107, 108, 124

Response to Overall Category Comment:

A key goal of the Red Line Extension is to utilize and integrate existing regional transit infrastructure to the greatest extent possible. CTA's bus and rail lines, Metra's commuter rail lines, and Pace's suburban bus services are interrelated. The Red Line Extension will be designed to establish and maintain convenient connections between transit services it intersects. In the Alternatives Analysis study, suggested connection points between the Red Line Extension, CTA bus and rail lines, and Metra commuter rail lines will be identified. In particular, opportunities may exist to develop new connections between the proposed CTA Red Line Extension and the Metra Rock Island District, Metra Electric District and/or the NICTD South Shore Line commuter rail systems, possibly at either existing Metra stations or at new station locations. Similarly, opportunities for connections between the CTA Red Line Extension and Pace bus services will also be explored. These connection possibilities will be further described and analyzed in Screen 2 and 3.

While transit integration is a key goal of the project, regional transportation integration of multiple modes is also a priority. As a part of the Alternatives Analysis process, CTA meets regularly with its counterparts at Metra, Pace, RTA, the Chicago Department of Transportation, the Illinois Department of

Transportation, and the Chicago Metropolitan Agency for Planning to promote coordination within all components of the region's transportation network. The Red Line Extension's Purpose and Need includes effectively managing future traffic growth in the study area. The CTA seeks opportunities to connect with other transportation elements as opportunities permit.

Other Specific Comments on this Topic:

Comment:

47. If the goal is to improve transit, why not increase frequency of Metra services on both sides of corridor and restructure east-west bus service connections without major capital projects?

Response:

Opportunities for changes or improvements to the existing Metra commuter rail service and CTA bus services within the corridor will be evaluated in detail during both the Screen 2 and 3 processes. These types of "lower capital cost investment" opportunities will be considered within the no-build and TSM alternatives described in Topic 6, as well as in conjunction and coordination with other more capital intensive options.

Comments:

51. Can you explain the intermodal modes at 130th and UPRR?
52. Is Intermodal transfer being evaluated at 130th and the Metra Electric Line on the Michigan Avenue Alternative?

Response:

The study area and alignments under consideration have locations where significant intermodal interchange facilities could be built. For example, at Michigan/Kensington a number of local bus routes could interchange with high-capacity transit service (regardless of the technology selected). As noted in a previous response, it is also possible that Metra's Southeast Service might operate over the UP alignment, and so also serve this intermodal facility. At 130th/Bishop Ford, a similar bus interchange is possible, which could also include a South Shore Line interchange station. For various corridor alternatives, an intermodal facility is also possible at 130th and the Metra Electric District (MED) Line, although a new 130th Street MED passenger station would need to be constructed.

17. Potential Red Line Extension Parking Facilities

General Comment:

Will parking facilities be proposed and where will they be located?

Pertains to specific comments:

2, 6, 21, 107, 108

Response to Overall Category Comment:

Parking facilities associated with the proposed transit improvements in the study area are considered along with station locations. The amount of parking to be constructed is determined by forecast station usage. Proposed station locations will be addressed in the Screen 2 process. At that time, the location of each station, the area served, and proximity to major arterials and/or highways will determine whether parking is recommended at each station. If parking is determined to be advantageous at a proposed station, patronage forecast for those stations will determine the number of parking spaces and the type of parking facility required (e.g. parking lot, parking garage).

18. Potential Red Line Extension Economic and Environmental Impacts

General Comment:

What will be the economic and environmental impact of the Red Line Extension? What will be the community and economic benefits of the Red Line Extension?

Pertains to specific comments:

25, 27, 36, 48, 64, 74, 75, 77, 84, 102, 109, 112, 114, 115, 126, 127, 130, 134, 140, 142, 152, 154, 155, 159, 169, 171, 178, 180, 181, 199, 202, 203, 205, 207, 208

Response to Overall Category Comment:

An Environmental Impact Statement (EIS) will analyze in detail the social, economic, and environmental consequences and benefits of the proposed Red Line Extension. The environmental review process required by the *National Environmental Policy Act* of 1969 (NEPA) and related laws includes environmental impact analyses and the preparation of documentation for public review. Per FTA guidance, the environmental evaluation begins upon completion of the Alternatives Analysis study, and it will result in a detailed written statement on the anticipated environmental impacts of the Red Line Extension and the steps that will be taken to reduce any negative impacts to the community and the natural environment.

Typically, environmental reviews for proposed transit projects address the potential impact areas of air and water quality, noise and vibration, historic and cultural properties, parklands, contaminated lands, displacement of residences and businesses, and community preservation. During the federal environmental review process, the CTA will work concurrently with state and other local agencies to also comply with state and local environmental laws. See Topic 12 for additional information about potential property acquisition and impacts.

Regarding the economic impact of the Red Line Extension, FTA guidance requires an economic analysis of the Red Line Extension to be conducted as a part of Screen 3 of the Alternatives Analysis. In general terms, it may be noted that numerous transit studies suggest that transit investments result in economic development. A recently conducted study by the U.S. Department of Transportation, found that for every $1 billion invested in transit projects, 47,500 jobs are created or sustained. Specific projections for the Red Line Extension may be developed in later studies.

Other Specific Comments on this Topic:

89. What are the environmental justice impacts in the AA and why weren't they made public?
172. Presidential Order 12898 detailed environmental justice principles, will CTA include this Order while making decisions about this development?
173. How is environmental justice issues being applied to this development of transportation?

Response:

Environmental justice will be considered throughout the subsequent levels of screening. During these periods the evaluation will identify potential environmental justice situations. These will be noted and alignment and station alternatives will be modified accordingly. Environmental justice is a specific focus in the preparation of the federal environmental impact statements which will begin after the selection of the Locally Preferred Alternative.

Comment:

86. Who will get to bid on these contracts for transportation jobs?

Response:

All contract procurement will follow CTA's competitive bidding requirements open to all qualified firms. More information about CTA's competitive bidding requirements is available on the CTA web site at www.transitchicago.com.

19. General Customer Service Questions/Compliments/Complaints

General Comment:

We have some general comments related to CTA and/or CTA service.

Pertains to specific comments:

15, 33, 70, 71, 93, 95, 117, 118, 132, 138, 139, 177, 180, 182

Response to Overall Category Comment:

CTA Customer Service representatives were also in attendance at the public meetings for the Red Line Extension and were available to answer specific questions on existing CTA services and to take suggestions for improvements to those services. Many questions submitted to the Red Line Extension study team also covered these topics, which are outside the purview of the study itself. The study team notes these questions and comments for the record and has referred them to the CTA Customer Service Department for an independent response and filing through CTA’s established Customer Service procedures.

Federal Transit Administration’s
New Starts Process

Red Line Extension
Alternatives Analysis Study

Schedule for Tonight’s Meeting

- **Structure of the meeting**
- **Questions and answers process**
  - Submit your comments in writing on comment cards
  - Comments and questions will be grouped and answered by topic
  - All comments and questions will be addressed on CTA’s website - www.transitchicago.com
  - An interpreter for the hearing impaired and a translator for the Spanish speaking community are available this evening

Screen 2 Public Involvement Process

- **Open Houses are scheduled as follows:**
  - Wednesday, December 3, 2008
    6 - 8 p.m. (presentation begins at 6:15 p.m.)
    Historic Pullman Visitor Center
    11141 South Cottage Grove
    Chicago, IL
  - Thursday, December 4, 2008
    6 – 8 p.m. (presentation begins at 6:15 p.m.)
    Woodson Regional Chicago Public Library
    9525 South Halsted Street
    Chicago, IL

Facilities are accessible to people with disabilities

Tonight's Speakers

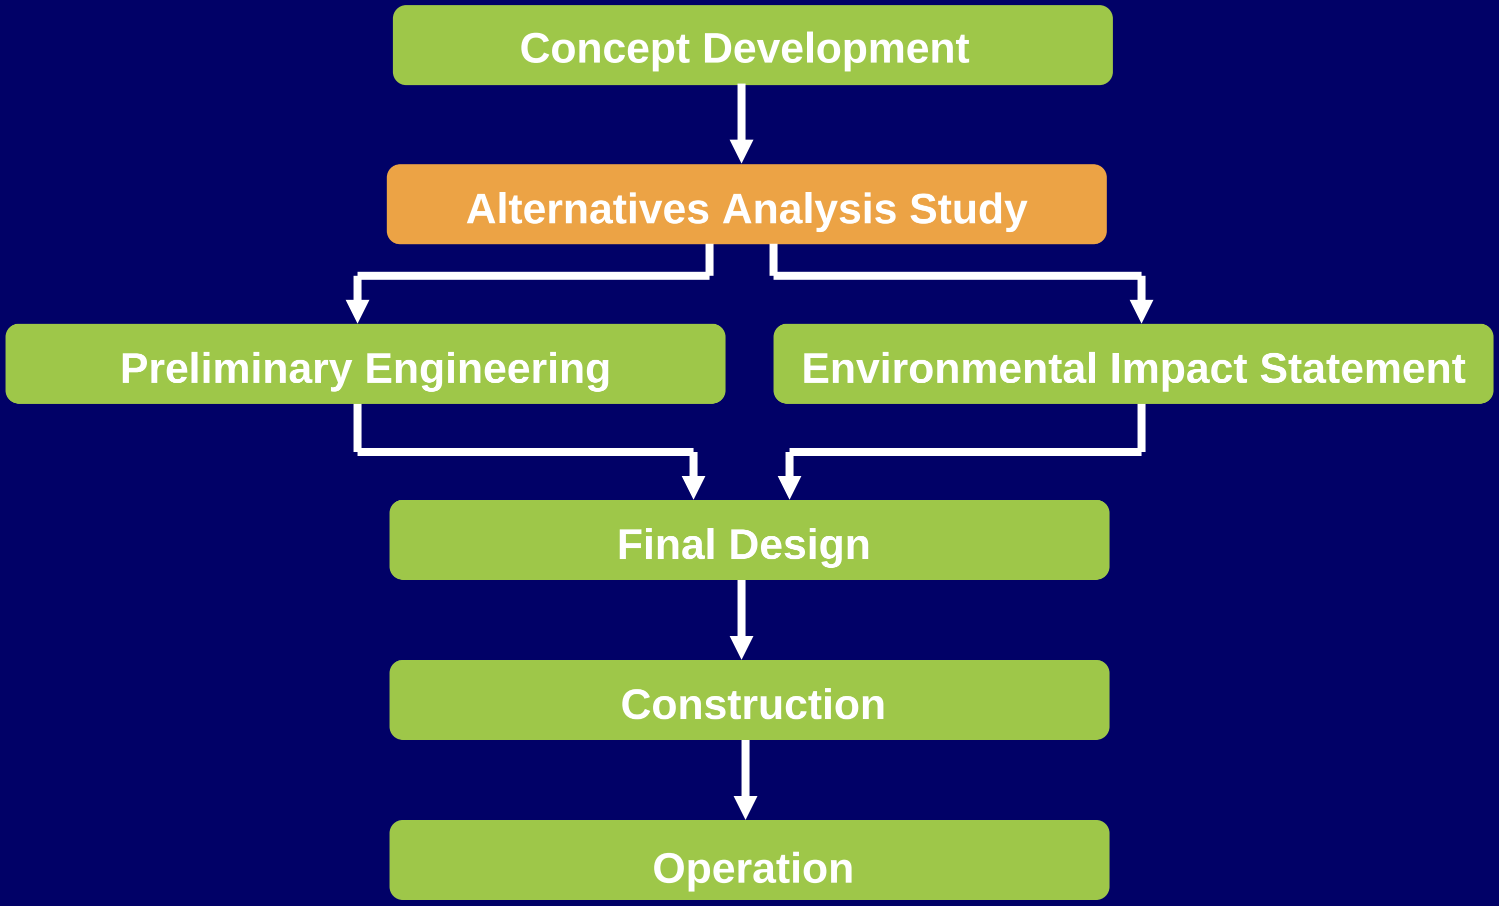
- Darud Akbar – Moderator
  - Chicago Transit Authority
- Jeffrey Busby – Strategic Planning Manager
  - Chicago Transit Authority
- Ronald Shimizu – Red Line Study Area Manager
  - Parsons Brinckerhoff

Outline of the Presentation

- Discuss Status of Red Line Extension Alternatives Analysis Study
  - New Starts Overview
  - Screen 1 Findings
- Screen 2 Preliminary Findings
- Public Involvement Process

Status of Study

FTA's Required New Starts Process



Concept Development

Alternatives Analysis Study

Preliminary Engineering

Environmental Impact Statement

Final Design

Construction

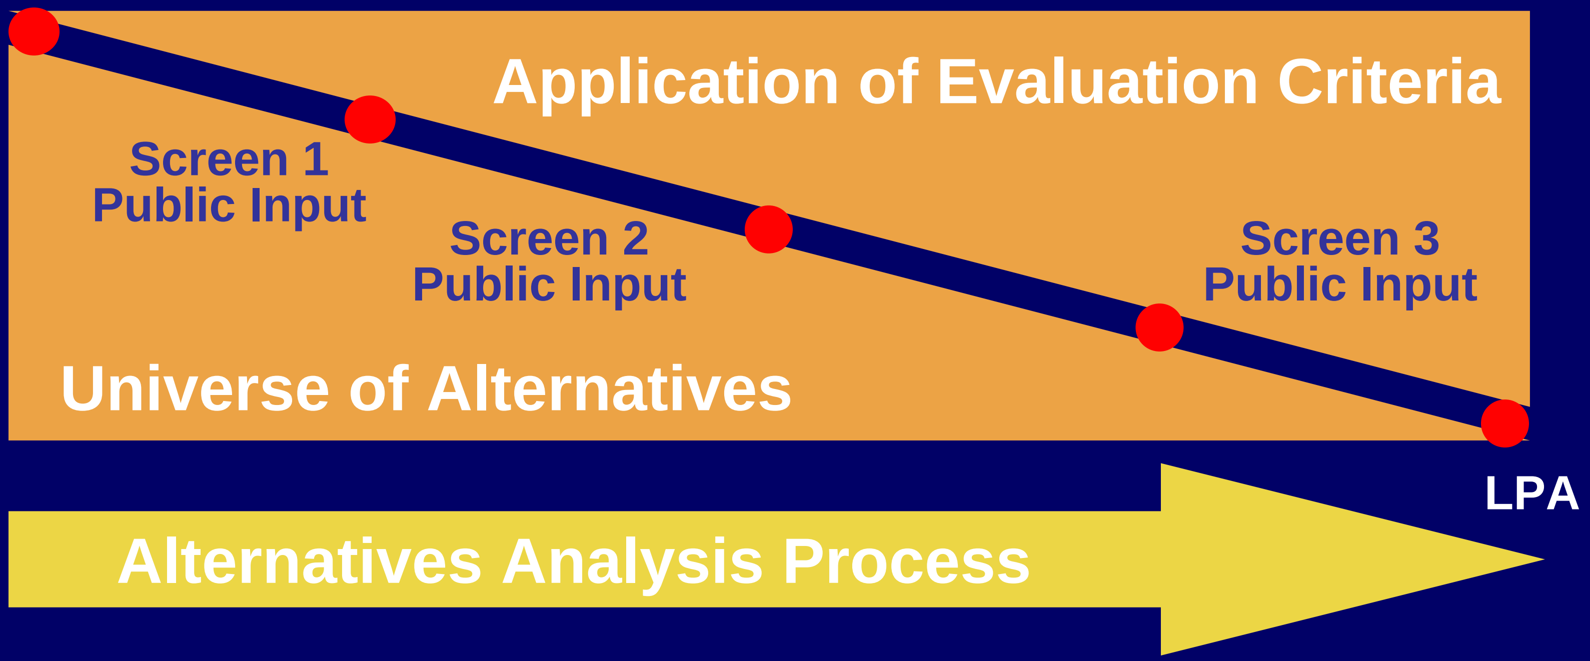
Operation

Alternatives Analysis (AA) Studies

- FTA Requirement for federal funding for transit expansion (New Starts)
- Identifies transit opportunities and ensures all practical solutions are considered
- Ensures planning is consistent among all New Starts projects throughout the country
- Provides opportunity to gather information and receive public input
- Identifies Locally Preferred Alternative

FTA Evaluation Process

The Purpose and Need is first defined, the evaluation criteria are applied, and options within the Universe of Alternatives are eliminated until, at the end of the process, there is a Locally Preferred Alternative (LPA).



Application of Evaluation Criteria

Purpose and Need

Transportation Needs

- Significant bus and passenger congestion at 95th Street Red Line Station
- Lengthy bus trips to access 95th Street Red Line Station
- Far South Area residents experience 20% longer commute than rest of City
- Traffic congestion is expected to grow along with study area population and employment

Opportunity for Improvement

- Extend rapid transit service south from 95th Street Red Line Station
- Improve access to, within, and beyond study area
- Stimulate economic development and job opportunities
- Shorten transit travel times through faster and more direct routings

Community Participation

Community participation is one of the key components of the alternatives analysis.

Community Outreach

- General Public
- Elected and Appointed Officials
- Community and Civic Organizations
- Faith-Based Organizations
- City and State Agencies

Ongoing Public Involvement/Input

- Meetings announced through public notices and advertisements
- Project updates on the CTA web site: www.transitchicago.com, accessible at local public libraries

Red Line Extension Alternative Analysis Study

Screen 2 Public Involvement - Public Comments and Questions

February 2008

No.	Comment/Question	Received Via*	Topic Area(s)
1	What will this extension do to CTA fares? Stay the same or increase?	STK	6
2	DCP (Developing Communities Project) has been advocating for the Red Line extension for 5 years and their work has, we believe, has helped to advance & promote construction of the Red Line Extension. Community impact and input is essential.	STK	15
3	Where does Red Line Extension fall in priority for Rapid Transit capital projects in Chicago?	STK	2
4	When identifying park and ride alternatives priority to look at vacant and available land/properties. Also, the impact of the surrounding community to newly created routes should be addressed via public hearings at that stage. Opportunity for neighborhood/community consensus. Widen your reach to advertising about this project to radar newspapers and public hearings. Job creation opportunities should be promoted and give transfer periods for this project.	STK	7, 12, 13
5	Again as discussed at the meeting a job creation plan for community and minority contractors is crucial. It is imperative that communities with CTA BBE/Mowp etc begin to prepare (certify, educate community on how to enter apprentice ship positions etc) begin. It may appear to plan to be prepared for construction opportunities five to ten years out is futile, but it is not. Please use our organization to set up training sites etc.	STK	13
6	How can the alternative analysis preferred alternatives be arrived at ahead of the environmental impact analysis when one of the routes- the UP Railroad- has significant environmental issues, effecting isolated communities like Altgeld Corridor?	HPC	1, 8
7	I think that the UP Rail Extension is the best alternative.	HPC	5
8* (8-9)	Subways are cost prohibitive? Why? Are the cost constraints the CTA's or the Fed governments?	HPC	8, 10
9	Bus pollution of BRT, how will it be mitigated?	HPC	13
10	What are the transit oriented development values associated with the 3 alternatives?	HPC	8
11	What is the process by which public involvement impacts the evaluation process if arriving at the locally preferred alternatives?	HPC	12
12	Best Alternative in my view: "Union Pacific/Heavy Rail" This would provide service to S Michigan, and Altgeld, and Hegewisch- Also, potential connections to 1. Metra Electric Rail 2. South Shore Electric Rail.	HPC	5
13	I am a longtime rider of this line when it was first open I ride from 95th State Street to Davis Street in Skokie, Illinois Daily and weekends. Sunday from 95th State Street to Dividend once at 6am to 4:30. I would like to know will the extension with go out I-94 to 130th Street or I-57 to 127th Street?	HPC	5
14	Would the amount of revenue generated by the local stops on the Red Line on the South side be a faster in determining the priority of the Red Line Extension via other New Starts Projects?	HPC	2
15	Will the Red Line Extension mean significant redesign of the 95th Street stop.	HPC	14
16	When will the CTA schedule the 3rd screening?	HPC	12
17* (17-18)	When will the final choice of the route be made, and who makes it?	HPC	1, 3
18	When the federal funds become available, how long will it take to get the matching funds? Is there an expectation of getting the matching funds?	HPC	11
19* (19-20)	When will you have the final choice between the different alternatives?	HPC	1, 3
20	When will the next analysis phase meetings take place?	HPC	12
21* (21-23)	When does the CTA anticipate a third and final alternative analysis meeting?	HPC	12
22	When will you make your final choice on the alternatives?	HPC	1, 3
23	What are the CTA's plans for searching matching funding?	HPC	11
24*(24-25)	When will the Red Line extension be a reality?	HPC	3
25	Once the choice is made on the route and the funds are available, how long will it take to complete the work?	HPC	1, 3
26	When does the CTA estimate construction will begin on the Red Line Extension?	HPC	3
27	When will you make the final choice on the alternatives?	HPC	1, 3
28*(28-29)	What are the cost estimates?	HPC	10
29	Where would the yard be located?	HPC	6
30	Will the rail options include park and ride?	HPC	5, 7

31	What are the dollar amounts for the 3 alternatives?	HPC	10
32	What are CTA plans for securing matching funding?	HPC	11
33	What does the CTA believe will be the cost estimate for the 3 final alternatives?	HPC	10
34* (34-38)	What is the impact of the proposed route on economic development?	HPC	8, 13
35	Which projects are being driven by the 2016 Olympics?	HPC	15
36	When will the people have an opportunity to let you know their favored route?	HPC	12
37	What are the CTA's plans for securing matching funds?	HPC	11
38	The UP elevated alternative sounds best.	HPC	5
39	Is the Red Line- rather the advancement of the project being driven by 2016 Olympics?	HPC	15
40* (40-41)	Has CTA proposed or surveyed the communities to obtain an estimate of ridership or preferences for rapid bus or rail?	HPC	1, 9, 12
41	Has rapid bus in other areas addressed the need for rail service?	HPC	5
42	It was stated that south area passengers experience a 20% longer commute currently. With each possibility (HB, HR, UPR) what would the impact be on decreasing the commute time?	HPC	3, 8
43	I am in favor of UP Route. I think that although Halsted is wide enough, any transit additional would make traffic worst.	HPC	5
44	Will the CTA, the RTA and IDOT present the Red Line Extension as a priority project as a public works project to the new Obama Administration?	HPC	2
45	I recommend the UP route for the service it will extend to the underserved area of the far southeast side of Chicago.	HPC	5
46	We need a route that would not make it necessary to transfer at 95th but extend the Red Line to city limits.	HPC	5
47	The Halsted End of the Line will not be as to limiting morning suburban traffic/ commuters to city. End of the line using UP track would be more am to parking and limiting traffic congestion on expressway- and promote access south to shore riders. The UP line offers more options for riders and does not congest community.	HPC	5
48	good meeting	HPC	15
49	The Red Line is the most used line in the city. It would be a great help to those living far south. Many who do not drive together to work, would be a help to them. Thank you.	HPC	15
50	Comment: UP Rail- Best Solution, Halsted Rail- 2nd Best, Halsted Bus- 3rd. UP Rail - Land necessary, impact on environment, etc. This is the top alternative in my opinion.	HPC	5
51	Not exactly a comment, but so far, I wish that the proposed routing of the UP Railroad goes through.	HPC	5
52	For the Heavy Rail/UPRR option, you could end at the 130th on the west side of the Bishop Ford Fwy, thereby preserving the ability to extend further south in the future, while also fitting in a station with walking access to Carver HS & Altgeld Gardens and a transfer station to the South Shore trains. Please see the sketch I sent to CTA a few months ago.	HPC	4, 5
53	This is a little specific but: would the 111/115 Pullman Route return to a "shuttle like" route whenever an alternative is chosen? As I understand, it did not travel to 95th and if so could it be extended to a 24 hour time?	HPC	14
54	Will the fare hikes have any bearing on the completion of the x-tension and is there an anticipated start date to begin construction?	HPC	3, 6, 11
55	What are ridership estimates for the UP Railroad and Halsted route? If ridership estimates have not been done, when will the estimates be done? When will ridership estimates be made public?	HPC	9
56	What are the socioeconomic factors taken into consider for environmental impact analysis?	HPC	8, 13
57	What percentage does socioeconomic impact carry in evaluating routes?	HPC	8, 13
58	What weight does access of isolated communities, like Altgeld Corridor have in evaluating alternatives?	HPC	8, 13
59*(59-61)	Of all projects considered, where does the red line prioritize? 1st, 2nd, 3rd, or 4th? What are the parameters that determine priority?	HPC	2
60	More buses will not help because decrease in funds will decrease bus service.	HPC	5
61	What are the costs of the three proposals?	HPC	10
62	Concept Development Alternative Analysis Study Preliminary Engineering Environmental Construction	WCPL	15
63	Send a copy of presentation and boards.	WCPL	12

64* (64-67)	When will there be a third and final Alternative Analysis meeting?	WCPL	12
65	When will the final choice be made?	WCPL	1, 3
66	Are there any ridership projections for the suggested alternative routes?	WCPL	9
67	How is funding for capital projects obtained?	WCPL	11
68	Are 4 stations along the Red Line Extension Heavy Rail alternative really enough stations to alleviate congestion and promote increase usage of the Red Line? Would it really help the South Side Communities?	WCPL	5
69	Sounds good, where will you get the money?	WCPL	11
70	Why not extend the red line further south to 130th St on Halsted?	WCPL	5
71	Is the land at 127th Street for a new longer train yard?	WCPL	6
72* (72-74)	The UP certainly seems most feasible. It is the most cost effective since the tracks are already there?	WCPL	8
73	How does the Red Line extension compare with other extensions in the city, i.e. circle, orange, etc. Is the Red Line #1? If not why not?	WCPL	2
74	Halsted BRT and UP HRT should both be utilized.	WCPL	5
75	What effect does the Canadian National's RR purchase of the EJ&E RR and subsequent rerouting of freight trains in suburban & city areas have in the final consideration?	WCPL	15
76	The Red line extension is a great idea but will the extension increase the cost for the rider in the city?	WCPL	11
77	Any Bus alternative will add to the congestion would be heavy rail (UP) tracks either elevated, or trench (ideally subway).	WCPL	5
78* (78-79)	I believe that the UP route for the red line extension is the best one.	WCPL	5
79	Is it true that the greatest financial benefit to the CTA would be through the selection of the UP route even though the initial cost might be more?	WCPL	10
80	I choose one of the red line extension is UP Railroad corridor because it connects with bus routes and other train stations. Please try to make the red line extension easy for the people and run on time.	WCPL	5
81	A Referendum was voted on in 2004 by @ 38,000 residents impacted by the Red Line Extension. The locally preferred alternative/the UP line is by far the best, most expedient, most beneficial to the most people, including seniors, and the disabled.	WCPL	5
82	What is the reasoning behind imposing an additional bus line on an existing bus line?	WCPL	5
83	The UP route provides transportation in the area where there is no existing public transportation, this being more accessible to more underserved people.	WCPL	5
84	I was in Boston in the fall of 2007 and rode their Green Line. It was an Articulated Hybrid Bus with the only difference being a Power Pole attached. It opened on an Express Busway. It took me from Boston Logan - Boston Amtrak in 15 minutes. I see an Electrified High Speed Bus way as a LOW COST Alternative Red Line Extension. Agree or Disagree	WCPL	5, 10
85	The city has spent money beautifying Halsted St. The elevated tracks would make the street darker and make it more unsafe looking and who would go underground in Roseland? There are churches in the area & schools what about noise especially on Sundays and street crossings?	WCPL	5, 13
86	Would like to get a hard copy of the power points presentation from both tonight and April of 2007 sent to me or made available for pick up at CTA Headquarters Lake Jefferson.	WCPL	12
87	I'm totally against the red line coming down Halsted.	WCPL	5
88	What exactly would the TSM be for the Red Line Study?	WCPL	8
89	What is the Baseline Alternative, and does not the BRT come closest to the Baseline alternative?	WCPL	8
90	What are the developments of the 3 final alternatives?	WCPL	5
91	How much displacement of residential housing and businesses do each of the options call for?	WCPL	13
92	Why exactly was the trench option for the UPRR HRT not recommended? Would the UPRR tracks really need to be in the trench as well?	WCPL	5, 10
93	Why was underground Heavy Rail for the UP route shot down?	WCPL	5, 10
94	UP Line? Can this line (track) be elevated? Along with existing track?	WCPL	5

95	Have there been examples of elevated rail over existing rail right-of-ways like to UP Railroad? The elevated would be constructed over the freight and Metra rail line.	WCPL	5
96* (96-99)	Since the Federal Government and the CTA are aware of the economic and social benefits that accrue around transportation projects, how will those issues be measured in deciding on the locally preferred route?	WCPL	8
97	Why has it taken decades to get this far with the red line extension, while other lines got completed in relatively short periods of time?	WCPL	3
98	Why has service to suburbs (north and west) received greater attention than service south of 95th?	WCPL	2
99	I highly recommend the UPRR route for the benefits to community.	WCPL	5
100	How important is resolving the train yard congestion at 98th as a factor in choosing the LPA?	WCPL	3, 6
101	How much does existing congestion on Halsted factor into evaluating the BRT option for Halsted?	WCPL	8
102	Comment: Just wondering what interface would be created between bus and rail at 95th, since this intersection is already heavily congested. Would Bus Rapid Transit keep the same schedule as the Red line? 24 hour service? What intervals or headway would BRT have? Same as Red Line? Would bus lines be rerouted as a result of implementing BRT. BRT & Heavy Rail- Median of Halsted? How to keep pedestrians & transit patrons safe? Similar to Day Ryan.	WCPL	6, 13, 14
103	Will the Extension of the Red Line cut the time of getting to your destination on time because the commit time is disgusting.	WCPL	8
104	What are the TOD values of the 3 alternatives?	WCPL	8, 13
105	What kind of support facilities are planned/proposed for New Stations? Will any of the Stations have "park and ride" facility? How many? Will passenger facilities (stations) have stores or stands? Is there any proposed construction for area adjacent to stations? Will only currently owned property be used? (for expansions)	WCPL	5, 7
106	Are the plans/proposals available to the public via CTA website?	WCPL	12
107	Where are your handouts?	WCPL	12
108	What is the CTA doing to obtain funding for its capital projects?	WCPL	11
109	The UP route seems to be the best route for the Extension.	WCPL	5
110* (110-112)	I'm addressing this letter to you about transportation expansion in the city of Chicago. My first issue I would like to talk about is the extension of the CTA Red Line. I think this service improvement is completely necessary, but I think it should be implemented in another form. Instead, I think service levels on the Metra Electric line should be increased to levels comparable with the proposed extension. When the name Metra is mentioned many people think of diesel locomotive pulling a string of cars behind it. However, this is not the case on the Metra Electric line as the name implies. With the electric power comes greatly increased acceleration power and lower operating costs due to not having to pay for diesel fuel. Electrical power is also quieter and pollution free compared to diesel locomotives. These are common characteristics that are shared with CTA trains and even though they are incompatible electrical systems, electrical power is necessary for increased service levels. This brings me to another point- no new cars would be necessary for the increased service levels because Metra has a large stockpile of cars that are used for the extremely frequent rush hour services. These	EMAIL	4
111	Also, the Metra line largely parallels the proposed route of the CTA extension. What would happen as a result is that these two lines would be competing for passengers which is not desirable in any business environment. Metra Electric ridership will decline because in 1969 when the CTA Dan-Ryan line was built ridership between 75th and 111th street stations declined 75%.[1] In addition, Metra Electric stations are far closer together than the CTA Red Line. This may be a little inefficient, but it is a convenience for riders and is a lot better than putting two lines right next to each other like the CTA is proposing to do. To resolve the issue of bus congestion at the CTA 95th station is very easy. If half of the buses were rerouted to nearby Metra stations (which many are closer to the bus routes) the issue would be solved. In addition, the plan of increasing trains on the Metra Electric could be implemented almost immediately compared to the years it will take to build the Red Line extension. Furthermore, the Red Line extension will be extremely cost prohibitive due to the soaring materials costs, acquisition of cars, and operating expenses. If you supported the implementation of the Met	EMAIL	4

112	I also wanted to give you an example of where a similar plan is being put into action. The location is London, and they are creating the Over ground Network. Most people would agree that London is light years ahead of the U.S. when it comes to public transportation, and the planners in London came to a startling conclusion. They realized that it was extremely expensive to build new subway lines, so they took commuter train lines, increased their frequency, and rebranded them into the Over ground network. This is essentially the same thing I'm proposing for the Metra Electric line without the rebranding. So basically, if train frequencies are increased on the Metra Electric and the CTA Red Line extension is not built, it will provide the same service to the taxpayers' of Chicago immediately with much less of their money being spent. I hope you take my suggestions into consideration.	EMAIL	4
113	Can "A" & "B" stops come back to the red line. Along Halsted St. or Michigan Ave, will the elevated be over the street like Lake St. or an adjacent alley?	USPS	5, 6
114	I believe you are making a mistake by considering only linear two-way travel extension options. A one-way loop extension at the end of an existing two-way mainline offers many advantages over a two-way linear extension. Attached is a proposal for a 10 mile long single track loop Red Line south extension. This extension would cost about the same as a two-way 5 mile long extension. But it's ten stations would make the Red Line accessible by walking to twice as many residents of the area as any of the nine two-way alternatives in your study. Note that: For a one-way loop extension compared to a two-way line with the same number of added stations: some trips take longer; but others are quicker. (see attached hypothetical example) One-way loop allows: Single side stations: no crossover structures, Use of narrower existing ROWs, Fewer cars ands operators and power consumption Let me know if you have any questions. Thanks you for your consideration. Sorry I am making my suggestion so late in your process. *Two documents attached	EMAIL	5
115* (115-116)	I can bloody well understand why Michigan Avenue was quashed south of 95th Street. In fact, I was wondering how trolleys plied Michigan Avenue in the olden days, in the first place! But just as most of the Green Line runs along alleys west of Calumet Avenue, and/or east of Prairie Avenue, couldn't a viable Red Line Extension use alleys west of Michigan Avenue, or is the environmental impact (noise) too great to make that an option this time around? Incidentally, I thought I could submit an idea to use Eggleston Avenue for a High Speed Electric Bus way-complete with overhead wires from 95th Street south to 127th and Indiana. But there were misgivings about doing that versus extending the rail portion.	EMAIL	5
116	Also: Has anyone thought about expanding the 95th Street Terminal for auto parking and bus marshalling using the air rights over the Dan Ryan Expressway?	EMAIL	5, 14
117	Thank you for the opportunity to voice my support for the Red Line extension to 130th/Altgeld. I have been attending meetings concerning this for at least 2 years. I continue to support the progress that has been made and I support the UNION PACIFIC ROUTE. This project would provide jobs, new business and a new mode of transportation for many residents. This extension is really needed. I am a regular rider on the Red Line and I would love to be able to have the additional stops. Thanks and keep me on your list for information regarding further developments.	EMAIL	5
118	I'm writing to inform you of the importance of the CTA Red Line. If extended to Altgeld Gardens it would help low-income families as well as our high school students who work. Please consider others when making your decision.	EMAIL	5
119	Please add me to your mailing list for the Greater Roseland Red Line Extension Project. Thank you.	EMAIL	12
120	This email is to indicate my families support of the Red Line extension and the support for the Union Pacific Route be used for the CTA Red Line Extension. The extension of the Red Line is long over due. The Roseland, Morgan Park, Altgeld neighbors were told this extension would happen when I was in grammar school I am now over 20 years in the working world and the extension is still talk. The extension of the Red Line is needed currently it takes two buses and over an hour just to get the 95th Street to board the Red Line.	EMAIL	5

121	I have been riding the Red Line from 95th Street to 4700 North for over 1 year now and I live near 115th and Halsted. The Red Line extension would benefit me and so many other CTA Red Line Riders. We could save time and money if the Red Line is extended to 130th Street. Please move on the Red Line riders behalf and get the extension plan moving a little faster. We have been meeting for over 3 years about this extension and what ever the riders and supporters of the Red Line extension need to do we will do.	EMAIL	3
122	I am writing to encourage you and others to extend the CTA Red Line from 95 Street to 130/Altgeld Gardens. Having lived in the south suburbs for almost 20 years, I know the frustration of not being near a CTA line and the extra time it takes to get to and from work. With over 40,000 people catching the El at 95th Street, I understand it has become the most profitable terminal for CTA. However, not so beneficial for a considerable number of those individuals who make up the 40,000 because they must first drive a long distances (from Altgeld, Riverdale, Dolton, South Holland, Calumet City) to take advantage of this mode of transportation. Extending the Red line could alleviate some of the burden of trying to find parking around 95 Street and then trying to get to work on time. An extension of the line could also help to increase employment opportunities for those in areas beyond 95 and increase CTA ridership. I enthusiastically support extending the Red line to 130/Altgeld and hope you and others will move to do so quickly.	EMAIL	5
123	I am in support of the 95th Street Red Line extension because and the Union Pacific Route: The 95th Street Red Line terminal is the most profitable terminal of all CTA Rails. Over 40,000 people use the 95th Street Rail each day. Most riders have to catch buses or taxis to get to and from the 95th street stop. Altgeld Gardens is the most isolated community in Chicago. Extending the Red Line would increase employment, as businesses develop around station stops. The proposed extension would run along the Union Pacific tracks, and would include stops at 103rd Street, 111th Street, 115th Street/Michigan, and 130th/Altgeld.	EMAIL	5
124	I support the Union Pacific Route to Altgeld. I take the el train everyday and have to catch a bus from the 95th Street line. This is an important part of transportation because our area is very isolated and in the evening, very dangerous.	EMAIL	5
125	Please accept this email as support in favor of extending the Red Line from 95th street to 130th/Altgeld via the union Pacific.	EMAIL	5
126	Please accept my support for the extension of the CTA Red Line from 95th Street to 130th/Altgeld using the Union Pacific Route.	EMAIL	5
127	I am very interested in the Red Line extension. My choice is the Union Pacific line. It is often very inconvenient for me to travel to 95th Street to get to the Loop. If the Red Line is extended to 130th and Stony Island it would make it so much easier for me to get around. I would love to park and ride.	EMAIL	5, 7
128	I wanted to make sure I sent you an email to express my great support of the Red Line Union Pacific extension. I live in the Washington Heights area and think that extending the red line is a fantastic idea. I work downtown and have to drive in order to make it into work at an appropriate time. However, having the redline closer to my home would allow me to substantially decrease my car usage and provide a better commute for me everyday. There is a substantial need to have increase transportation on the south side outskirts of Chicago. The citizens in this neighborhood deserve the services just as does the rest of the city. Here are some of other great reasons that this project should proceed: The 95th Street Red Line terminal is the most profitable terminal of all CTA Rails. Over 40,000 people use the 95th Street Rail each day. Most riders have to catch buses or taxis to get to and from the 95th street stop. Altgeld Gardens is the most isolated community in Chicago. Extending the Red Line would increase employment, as businesses develop around station stops. The proposed extension would run along the Union Pacific tracks, and would include stops at 103rd Street, 111th Street, 115th Street/Michigan, and 130 Please move forward with the expansion project as this will be a positive move for both the CTA and the city of Chicago!	EMAIL	5

129	I am sending this email because I believe that it is a excellent idea to extend the Red Line to 130th. Everyone I know that rides the Red Line everyday has to catch a bus or call a cab or a family member. I'm sure that the money that is spent expanding the Red Line will be reimbursed ten-fold when the project is complete!	EMAIL	15
130	I support the extension of the Union Pacific Route which will commute people to and from 130th/Altgeld Gardens.	EMAIL	5
131	Please accept my support for the extension of the CTA Red Line from 95th Street to 130th/Altgeld using the Union Pacific Route.	EMAIL	5

Chicago Transit Authority
Red Line Extension Alternatives Analysis Study

Screen 2 Public Involvement
Responses to Public Comments and Questions

17 February 2009

Written questions and comments regarding the Red Line Extension Alternatives Analysis Study were submitted by a variety of individuals and groups from throughout the Chicago region at the study's Screen 2 Public Meetings held on December 3 and 4, 2008. In addition, public comments and questions on Screen 2 were submitted directly to the Chicago Transit Authority (CTA) via e-mail and postal mail through December 18, 2008.

All of the questions and comments have been collected and compiled to provide a comprehensive review of the issues raised along with CTA's responses. Every question, comment, and suggestion submitted during the public comment period has been compiled in the ―Outreach Comment Database" (see separate document). Each question has been recorded verbatim and assigned a number that corresponds with the answers provided in this document, ensuring every question or comment submitted has been reviewed and answered or acknowledged. Collectively, the public comments and preferences will be considered in the evaluation of alternatives and concepts introduced through the public involvement process and may be evaluated and/or reflected in advancing alternatives as appropriate.

Many of the comments received were very similar in nature. As a result, similar comments and their responses have been grouped by topic and ―General Comment" heading below to avoid duplicative responses. Questions or comments requiring individual or specific responses are also included below along with unique responses. In order to understand some terms used in the Comments and Responses, it may be necessary to review the original Screen 2 presentation materials which are posted on CTA's Web site www.transitchicago.com (click on News and Initiatives, then Alternatives Analysis Studies).

The list below shows the index of topics covered in the report, along with the number of comments received for each. Because comments often refer to more than one topic, the numbers associated with each do not equal the total number of comments received.

Index of Topics

1. FTA's Alternatives Analysis Process (8)
2. Relationship of Red Line Extension to Other Proposed Transit Projects (6)
3. Overall Red Line Extension Project Timeline, Purpose and Need (12)
4. Red Line Extension Study Area (4)
5. Alternatives Analyzed (50)
6. Proposed Red Line Extension Operations (7)
7. Potential Red Line Extension Parking Facilities (4)
8. Evaluation Criteria Used in the Alternatives Analysis Study (15)
9. Ridership Estimates and Related Issues (3)
10. Project Cost Estimation (9)
11. Funding of Red Line Extension Construction and Operations (9)
12. Alternatives Analysis Public Involvement Process and Format (13)
13. Potential Red Line Extension Economic and Environmental Impacts (11)
14. Potential Red Line Extension Impacts on Existing CTA Services (4)
15. Other (8)

1. FTA’s Alternatives Analysis Process

General Comment:

Please describe the Federal Transit Administration’s (FTA) Alternatives Analysis process and its components.

Pertains to Specific Comments:

17, 19, 22, 25, 27, 40, 65

Response to Overall Category Comment:

Alternatives Analysis has for over 25 years been a key part of FTA’s decision-making process for awarding grant funding to support fixed guideway transit projects. Federal law requires that projects seeking grant funding from FTA’s New Starts program be based upon the results of an alternatives analysis study and subsequent preliminary engineering. Alternatives analysis has also been a part of established transportation planning practice in the United States for several decades. At its core, alternatives analysis is about supporting local decision-making. An effective alternatives analysis answers the questions: What are the transportation problems in a corridor? What are their underlying causes? What are viable options for addressing these problems? What are their costs? What are their benefits?[1]

The Red Line Extension project is currently conducting its Alternatives Analysis study. The Red Line Extension Alternatives Analysis study will have three steps or “screens.” Screen 1, completed in April 2007, issued preliminary findings regarding corridors, alignments, and vehicle technologies that should be advanced to Screen 2 for further analysis. Screen 2, just completed in December 2008, further refined the alternatives from Screen 1. These findings have determined three alternatives that should be studied further. Screen 3 will be a quantitative screening process; costs and ridership will be projected and operational questions considered. Screen 3 will result in the recommendation of a Locally Preferred Alternative (LPA) which, with FTA approval, will subsequently undergo environmental analysis and preliminary engineering.

A detailed description of the formal FTA Alternatives Analysis process is available at the Federal Transit Administration’s web site: http://www.fta.dot.gov/planning/planning_environment_5221.html .

Other Specific Comments Noted on this Topic:

Comment:

6: How can the alternative analysis preferred alternatives be arrived at ahead of the environmental impact analysis when one of the routes- the UP Railroad- has significant environmental issues, effecting isolated communities, like the Altgeld Corridor?

Response:

While the formal federally mandated Environmental Impact Statement (EIS) is not completed until after the selection of a Locally Preferred Alternative, environmental issues and community impacts are considered for each corridor and technology studied in the Alternatives Analysis. The subsequent EIS phase is used to quantify both positive and negative environmental impacts in detail and develop mitigation measures where necessary. See Topic 8 for more information about evaluation criteria used in the screening process.

2. Relationship of Red Line Extension to Other Proposed Transit Projects

General Comment:

What is the relationship between the Red Line Extension and other projects being considered by CTA? Is the Red Line Extension the highest priority?

Pertains to Specific Comments:

3, 14, 59, 73, 98

Response to Overall Comment Category:

Every five to six years, the United States Congress enacts legislation that authorizes federal funding for highway, transit, motor carrier, safety, and research programs across the country. This federal support represents the primary source of capital funding for CTA and other transit agencies throughout the U.S. The current legislation, known as SAFETEA-LU (Safe, Accountable, Flexible, Efficient Transportation Equity Act - A Legacy for Users), authorizes the federal transit and highway programs through 2009. President Bush signed the act into law on August 10, 2005.

The SAFETEA-LU legislation authorized CTA to seek federal New Starts grant support for four new rail lines or line extensions including: the Red Line Extension to 130th Street; the Orange Line Extension to Ford City; the Yellow Line Extension to Old Orchard; and the Circle Line. In order to qualify for New Starts funding, CTA is required to perform comprehensive Alternatives Analysis studies for each. Alternatives Analysis studies for all four projects are currently underway following the same federally mandated process as the Red Line Extension study, but addressing the unique transportation needs of their respective study areas.

A key objective of the Federal Transit Administration's Alternatives Analysis process is to measure all transit projects from across the nation by the same set of standards. This process ranks projects based on this measurement and not on where they are located. In this way, the benefits and costs of a project can be objectively measured in comparison to all others. Acknowledging that each project has a unique Purpose and Need, the process allows multiple projects from the same region to be rated highly. It is not unusual for a large region such as Chicago to seek approval for several major transit initiatives at the same time. In the late 1990s, CTA won New Starts funding approval for both the Cermak (Douglas) Branch reconstruction and the Brown Line capacity expansion project at the same time. Metra has also received New Starts funding for multiple projects at the same time. New York City in 2005 had two multi-billion dollar transit projects approved for New Starts funding.

CTA is preparing all of the New Starts projects to be advanced simultaneously from Alternatives Analysis with the selection of Locally Preferred Alternatives in each study area by fall 2009.

In order to qualify for federal funding, regional transportation projects must also be included in an official Regional Transportation Plan. Chicago's Regional Transportation Plan is prepared by the Chicago Metropolitan Agency for Planning[2] (CMAP) with input from local and state government agencies (including CTA), community organizations, and the general public. The plan is updated regularly and the Red Line Extension project is included in the plan. The most recent comprehensive update of the 2030 Regional Transportation Plan (RTP) was prepared in 2006 and involved extensive public outreach meetings throughout the region in May and June of 2006. A technical update of the 2030 RTP was also completed in 2008. Additional information on this plan can be found on CMAP's ―Shared Path 2030" web site http://www.cmap.illinois.gov/sp2030/sp2030main.aspx?terms=2030.

Other Specific Comments Noted on this Topic:

Comment:

44: Will the CTA, the RTA and IDOT present the Red Line Extension as a priority project as a public works project to the new Obama Administration?

---

[2] CMAP was created in 2006 by the merger of the Chicago Area Transportation Study (CATS) and the Northeastern Illinois Planning Commission (NIPC).

Response:

CTA can only speculate that the President's support for transit will be beneficial to transit and transportation systems in our nation. However, CTA is subject to the federal New Starts process that both guides prudent planning activities and determines the evaluation steps required for additional funding.

Current details of a federal stimulus plan that may include additional funding for urban transit systems suggest that funding would need to be spent in a short time frame to have the desired stimulus and jobs creation. This type of funding, as currently specified, would not be available to New Starts projects; however, CTA is reviewing details of the stimulus package and its likely impacts on the CTA. If New Starts funding were increased through stimulus measures, CTA would propose to advance progress on all of its New Starts projects into subsequent Preliminary Engineering and Environmental Impact Statement project phases.

3. Overall Red Line Extension Project Timeline, Purpose and Need

General Comment:

What is the timeline of the project and when will the Locally Preferred Alternative be selected? How long will it take from design until operation?

Pertains to Specific Comments:

17, 19, 22, 24, 25, 26, 27, 42, 54, 65, 97, 100, 121

Response to Overall Category Comment:

Fixed guideway projects are resource intensive and are rarely funded through local funding sources alone. In order to obtain federal funding for fixed guideway projects such as an extension of a rail line, the FTA developed a funding application process called the New Starts process. The FTA New Start grant program requires conceptual transit project proposals to proceed through a formal process of planning, design, and construction. Upon completion of this process, the project is ready for operation. The process involves five formal steps: Alternatives Analysis (AA); Environmental Impact Statement (EIS); Preliminary Engineering (PE); Final Design (FD); and Construction. Each of these steps typically takes 2-3 years to complete. Initiation of each step is also contingent upon continued availability of federal and local funding, the timing of which will also affect the overall project schedule. For highly complex projects the Final Design and Construction steps take longer, particularly if construction is implemented in sequential phases rather than all at once.

In the Alternatives Analysis step, the project's purpose and need is identified, alternatives to address the purpose and need are developed and evaluated, comprehensive and on-going public involvement is initiated, and a Locally Preferred Alternative (LPA) is determined. The Red Line Extension project's "purpose and need" is to improve transportation access and enhance opportunity for economic development within the study area. In particular, transportation improvements are needed to reduce the significant bus and passenger congestion at CTA's existing 95th Street Red Line station; reduce lengthy bus trip times to access the 95th Street Red Line station from neighborhoods south of 95th Street; reduce the lengthy transit commute times experienced by many residents of the study area; and more effectively manage future traffic growth in the study area. Extending Red Line transit service south of 95th Street is intended to stimulate economic development and enhance job opportunities by improving access to, within, and beyond the study area and shortening transit travel times through faster and more direct transit service.

The Red Line Extension project is currently in the Alternatives Analysis phase. The next step is preparation of an Environmental Impact Statement (EIS). In this step, potential environmental, financial and economic impacts of each alternative are identified, potential environmental impacts of the LPA are analyzed; environmental mitigation strategies are developed, public hearings are conducted to receive input, and a formal Record of Decision is received from the FTA upon successful completion. The Preliminary Engineering step involves engineering effort to support the EIS (30% design level), development of project phasing and construction staging, and feasibility review of mitigation approaches for construction or operational impacts. In the Final Design step the engineering design started in PE is completed, capital and operating cost estimates are updated and construction drawings are prepared, and a Full Funding Grant Agreement is obtained from the FTA upon successful completion. The Construction step commences when federal and local matching funds are secured.

The current Red Line Extension Alternatives Analysis study is expected to conduct the final, Screen 3, public involvement meetings in summer 2009. Prior to these meetings, CTA will complete the quantitative analysis that will help to identify an LPA in the study area. This LPA will be presented at the Screen 3 public outreach meetings and public comments will be reviewed before CTA makes its selection final in late summer 2009. CTA anticipates completing technical work to support an LPA recommendation and submission to the FTA for project advancement in fall 2009.

Specific Comments Noted on this Topic:

Comment:

100: How important is resolving the train yard congestion at 98th as a factor in choosing the LPA?

Response:

A Locally Preferred Alternative cannot advance if it has technical or operational shortcomings without proposed solutions. However, several alternatives exist for resolving congestion at the 98th Street yard.

4. Red Line Extension Study Area

General Comments:

What are the boundaries of the project study area? How were those boundaries determined?

Pertains to Specific Comments:

52, 110, 111, 112

Response to Overall Category Comment:

A key component of the Alternatives Analysis process is specifying a study area of a definite size for the project. The goal is to establish a specific area and to define the transit challenges and opportunities within this particular space, so that potential solutions can be measured against these defined challenges. Keeping the study area focused also helps to avoid confusion between multiple unique transit project proposals within the same city or region. Too large a study area can make it too difficult to determine accurately whether the potential solutions effectively address the identified transportation needs.

The Red Line Extension study area is bounded by the current terminus of the existing CTA Red Line at 95th Street (9500S) on the north, the Little Calumet River (approximately 13400S) on the south, Ashland Avenue (1600W) on the west, and Stony Island Avenue (1600E) on the east. The study area is four miles east-to-west and approximately five miles north-to-south. These boundaries define an area with numerous opportunities for improving transit connections and growing transit market share. A key goal of the Red Line Extension is to improve transportation access and enhance opportunities for economic development. In particular, transportation improvements are needed to reduce the significant bus and passenger congestion at CTA's existing 95th Street Red Line station; reduce lengthy bus trip times to access the 95th Street Red Line station from neighborhoods south of 95th Street; reduce the lengthy transit commute times experienced by many residents of the study area; and more effectively manage future traffic growth in the study area. Extending Red Line transit service south of 95th Street is intended to stimulate economic development and enhance job opportunities by improving access and shortening transit travel times through faster and more direct transit service. The study area boundaries encompass the areas that would benefit most directly from such transit service improvements.

For more information on the details of the study area, please see the Screen 1 presentation materials available for download at the CTA's website www.chicagotransit.com as noted in the introduction to this document.

Other Specific Comments Noted on this Topic:

Comment:

We have questions relating to the ―Gray Line” proposal and its consideration in this Alternatives Analysis.

Pertains to Specific Comments:

110, 111, 112

Response:

The ―Gray Line” proposal calls for operational changes to increase service frequency on the Metra Electric District Line and improve CTA connections to this facility as well as fare integration between regional transit services.

Opportunities for changes or improvements to the existing Metra commuter rail service and CTA bus services within the corridor will continue to be evaluated in detail during Screen 3. These types of ―lower capital cost investment” opportunities will be considered within the no-build and TSM alternatives (described in Topic 8), in conjunction with other more capital intensive options. Additionally, CTA is focusing attention on identifying possibilities to enhance intermodal interchange on the various alignments.

A proposed ―Gray Line” meets some of the needs of the study area, such as reducing the lengthy transit commute times experienced by many residents of the study area. However, it will not be included as a build alternative in the current Alternatives Analysis because it does not comprehensively address all of the needs of the project, including alleviating the bus and passenger congestion at 95th Street Red Line station or reducing travel times of passengers that transfer from bus to CTA rail to access their destination. Additionally, as noted in the Screen 1 analysis (available at www.transitchicago.com – click on News and Initiatives, then Alternatives Analysis Studies) commuter rail has several characteristics that are less favorable for the study area than other modes analyzed (such as bus and heavy rail).

5. Alternatives Analyzed

General Comment in Support of UPRR Alternatives:

Many comments received support extending CTA Red Line service along the Union Pacific Railroad corridor. Additionally, some comments expressed opposition to advancing the Halsted Street Corridor or Bus Rapid Transit alternatives.

Pertains to Specific Comments:

7, 12, 38, 43, 45, 46, 47, 50, 51, 60, 74, 77, 78, 80, 81, 83, 85, 87, 99, 109, 117, 120, 122, 123, 124, 125, 126, 127, 128, 130, 131

General Comment for Various Alternatives Analyzed:

Please provide more information about the combined corridor-technology-vertical profile alternatives analyzed in Screen 2.

Pertains to specific comments:

13, 30, 52, 72, 74, 90, 94, 116

Response to Overall Category Comment:

In Screen 1, CTA evaluated potential transit corridors, vehicle technologies, and vertical profiles to determine which would be appropriate to meet the needs of the proposed Red Line Extension. From this analysis, three transit corridors (Halsted Street, Union Pacific Railroad (UPRR) right-of-way, Michigan Avenue) and two vehicle technologies (Bus Rapid Transit (BRT), Heavy Rail Transit (HRT)) were advanced. Additionally, for rail alternatives, three vertical profiles (elevated, subway, trench) were advanced and for bus alternatives, one vertical profile (at-grade) was advanced. These components were combined to create specific alternatives and in total, eight alternatives were advanced to Screen 2.

(For more information about all of the alternatives evaluated in Screen 1, see Screen 1 presentation, technical boards and public comments and responses posted on the CTA website www.transitchicago.com – click on News and Initiatives, then Alternatives Analysis Studies).

In Screen 2, two bus alternatives were evaluated, as follows: 1) Halsted Street BRT at-grade, which is proposed to travel via an exclusive travel lane right-of-way from Vermont Avenue/Halsted Street to the Red Line 95th Street terminal station; and 2) Michigan Avenue BRT at-grade, which is proposed to travel via an exclusive travel lane from 127th Street/Michigan Avenue to the Red Line 95th Street terminal station. Both of these alternatives were defined with BRT station stops proposed every half mile on their respective north-south arteries, consistent with BRT stop spacing, and no stops proposed on 95th Street. The vehicles anticipated for the BRT alternatives would be articulated buses that would be hybrid diesel-electric powered or use alternative fuels.

In addition to the two bus alternatives, six rail alternatives were evaluated, as follows: 1 & 2) Halsted Street HRT elevated and underground alternatives. Both of these alternatives would depart the current CTA 95th Street terminal station and follow the I-57 Expressway median, transitioning to either an elevated or underground structure at Halsted Avenue, where these alternatives would travel south on Halsted Street to Vermont Avenue. These proposed alternatives are both 4.9 miles long and have four station stops – at Vermont Avenue, 119th Street, 111th Street, and 103rd Street – consistent with modern rapid transit station spacing. 3 & 4) UPRR HRT elevated and trench alternatives. Both of these alternatives would follow the I-57 Expressway as it traveled south from the 95th Street terminal station until the UPRR corridor, where it would turn south to follow the corridor. The UPRR corridor travels south to approximately 111th Street, and then travels southeast until the proposed terminal location at 130th Street near the I-94 Bishop Ford Freeway. These alternatives are 6.0 miles long and have four proposed stations – at 130th Street, 115th Street, 111th Street, and 103rd Street. 5 & 6) Michigan Avenue HRT elevated and underground alternatives. Both of these alternatives would follow the I-94 Bishop Ford Expressway median and transition to either an elevated or underground structure at Michigan Avenue, where these alternatives would travel south on Michigan Avenue to 127th Street. These proposed alternatives are both 4.1 miles long and have four station stops – at 127th Street, 119th Street, 111th Street, and 103rd Street.

All rail transit alternatives would be powered via an electric third rail, consistent with the existing CTA system and rail cars would be equivalent to those used by the existing fleet. Note that with regard to the UPRR Corridor, CTA and UPRR operate services with incompatible train cars and power systems; therefore, in the proposed UPRR Corridor, CTA will have its own dedicated tracks. The elevated alternative would operate above the existing UPRR freight right-of-way (currently at-grade); whereas the trench alternative would be in a cut below the surface, with the UPRR freight right-of-way relocated in the trench as well, adjacent to the CTA right-of-way.

All alternatives currently have Park and Ride lots proposed in proximity to their terminal stations; for more information about parking facilities, see Topic 7.

Several recommendations and preferences for potential alternative and terminal configurations were provided on the question/comment cards submitted by the public. Many are derivations of the alternatives already defined. Others significantly differ from the alternatives proposed by the CTA. Staff will review all suggestions and incorporate in the analysis those that merit further consideration.

Other Specific Comments on this Topic:

Comment:

41: Has rapid bus in other areas addressed the need for rail service?
82: What is the reasoning behind imposing an additional bus line on an existing bus line?

Response:

Bus Rapid Transit (BRT) is an option for introducing certain features of rail service (for example, dedicated right-of-way and multi-door boarding) at a lower capital cost and on a more accelerated timeline than building new rail lines. Several cities in North America have successfully adopted BRT services, including New York, Los Angeles, Cleveland, Kansas City, Toronto, and Mexico City.

Introducing BRT in a local bus corridor can increase travel options for customers with different needs. For example, BRT routes may be ideal for those who are willing to walk further to a stop in exchange for a faster more predictable trip, while local routes may be a preferred option for those with limited mobility or those making short trips. Providing both services in one corridor ensures that diverse travel needs are met.

Comment:

68: Are 4 stations along the Red Line Extension Heavy Rail alternative really enough stations to alleviate congestion and promote increase[d] usage of the Red Line? Would it really help the South Side Communities?

Response:

Proposed station locations on each of the rail alternatives are consistent with modern rapid transit station spacing – about one-mile between station stops. In some cases, such as on the UPRR corridor, larger gaps exist between station locations due to the lack of development between proposed stops. Additionally, buses on east-west arterials will be able to service the rapid transit station in closest proximity to that bus line, allowing the proposed Red Line Extension to divert many bus trips currently traveling on north-south arterials in the study area to the 95th Street terminal station. Proposed Park and Ride facilities will provide more convenient auto access and promote transit use in the study area.

Comment:

70: Why not extend the red line further south to 130th St on Halsted?

Response:

The Halsted Street BRT and HRT alternatives were designed to capture the majority of potential transit riders in the Halsted Street corridor, without crossing the Calumet Sag / Little Calumet River located at Halsted Street just south of 129th Street where development density drops significantly. The proposed terminal location of the Halsted Street BRT and HRT alternatives is located at Vermont Street, just two blocks north and within walking distance of the southernmost intersection with Halsted Street in the City of Chicago.

Comment:

84: I see an Electrified High Speed Bus way as a LOW COST Alternative Red Line Extension. Agree or Disagree?
115: Incidentally, I thought I could submit an idea to use Eggleston Avenue for a High Speed Electric Bus way-complete with overhead wires from 95th Street south to 127th and Indiana.

Response:

Bus Rapid Transit (BRT) is an option for introducing certain features of rail service (for example, dedicated right-of-way and multi-door boarding) at a lower capital cost (and on a more accelerated timeline) than building new rail lines.

Eggleston Avenue has a similar width as Michigan Avenue, which is too narrow to support a dedicated BRT corridor.

Propulsion technology for the BRT alternatives has not yet been finalized; however, vehicles are anticipated to be articulated buses that would be hybrid diesel-electric powered or use alternative fuels.

Comment:

92. Why exactly was the trench option for the UPRR HRT not recommended? Would the UPRR tracks really need to be in the trench as well?
93. Why was underground Heavy Rail for the UP route shot down?

Response:

Due to the limited right-of-way available for rail infrastructure in the UPRR corridor, if the CTA Red Line Extension were to be placed in a trench, as considered in one alternative in Screen 2, then the UPRR right-of-way would also need to be placed in a trench. The configuration of rail lines require minimum distances on either sides of the rail tracks and a trench alignment increases these requirements. Without placing the UPRR rail line in a trench as well, the available right-of-way would not be sufficient for both services to operate. While there are some additional environmental impacts from placing the UPRR rail line in a trench, such as transferring higher elevation diesel emissions to ground-level, the primary reason that this corridor was not advanced was due to the increased cost. Additional costs to put the freight line in a trench will not accrue additional benefits to transit users, making this alternative less cost-effective than the elevated UPRR alternative.

Comment:

95: Have there been examples of elevated rail over existing rail right-of-ways like to UP Railroad?

Response:

Portions of the CTA Orange Line are elevated over a freight railroad right-of-way.

Comment:

105: What kind of support facilities are planned/proposed for New Stations? Will any of the Stations have "park and ride" facility? How many? Will passenger facilities (stations) have stores or stands? Is there any proposed construction for area adjacent to stations? Will only currently owned property be used? (for expansions)?

Response:

Park and Ride facilities are planned in all proposed Red Line Extension alternatives. Size, configuration and specific locations will be determined in Screen 3. Additionally, Park and Ride facilities at intermediate stations as well as station details included in the station area plans will also be developed in Screen 3.

Comment:

113: Along Halsted St. or Michigan Ave, will the elevated be over the street like Lake St. or an adjacent alley?

Response:

In Screen 2, the Halsted Street and Michigan Avenue Corridors both included elevated rail alternatives that would travel over the existing street (not in an adjacent alley). However, the engineering design of these elevated structures has not yet been defined. As suggested, an elevated rail line may have a box-shaped support such as on Lake Street. An alternate elevated structure design on the CTA system exists on the Orange Line, which uses hammerhead columns – a center support that opens for the elevated track structure. Modern engineering variations will be considered for elevated structures advancing to Screen 3.

Comment:

114. I believe you are making a mistake by considering only linear two-way travel extension options.

A one-way loop extension at the end of an existing two-way mainline offers many advantages over a two-way linear extension.

Attached is a proposal for a 10 mile long single track loop Red Line south extension. This extension would cost about the same as a two-way 5 mile long extension. But its ten stations would make the Red Line accessible by walking to twice as many residents of the area as any of the nine two-way alternatives in your study.

Response:

A loop alternative would enhance coverage of the study area but would result in longer travel times on the guideway. Many potential customers in the study area are geographically dispersed and are anticipated to access the rail line by bus or auto beyond the immediate station area as they do today and therefore need faster travel times on the guideway such that transit remains competitive with other modes.

6. Proposed Red Line Extension Operations

General Comment:

How will the service operate? Will the trains run 24 hours and what will be the fare?

Pertains to Specific Comments:

1, 54, 102, 113

Response to Overall Category Comment:

CTA assumes that any new CTA service will be generally consistent with current CTA operating practices and seek to provide customers with safe, frequent and reliable travel options. CTA assumes that the proposed Red Line Extension will operate the same hours as existing Red Line service and that the fare would be consistent with existing fares at the time of implementation. Any new CTA service and associated facilities recommended by this study would be consistent with the Americans with Disabilities Act (ADA) requirements.

Other Specific Comments on this Topic:

Comments:

29: Where would the yard be located?
71: Is the land at 127th Street for a new longer train yard?
100: How important is resolving the train yard congestion at 98th as a factor in choosing the LPA?

Response:

CTA has explored some preliminary yard location sites for each of the proposed rail alternatives. For the Halsted Street HRT elevated alternative, a preliminary yard location has been identified on the west side of Halsted Street near industrial areas in the middle of the corridor. For the UPRR HRT elevated alternative, possible yard sites could be accommodated along the southern leg of the proposed alignment in adjacent industrial areas.

Identifying yard space in coordination with the proposed alternatives is one way to accommodate additional trains required to serve a rail line extension; however, other operational improvements can achieve similar goals. The feasibility of accommodating additional trains at alternate yard locations in the CTA system will also be considered as part of this study.

7. Potential Red Line Extension Parking Facilities

General Comment:

Where will parking facilities be located? Will you look at vacant and available land/properties?

Pertains to Specific Comments:

4, 30, 105, 127

Response to Overall Category Comment:

The CTA is considering Park and Ride facilities for each of the bus and rail alternatives included in Screen 2. For each corridor, Park and Ride facilities are being considered at the terminal locations of the proposed Red Line Extension alternatives. Additionally, in Screen 3, further analysis on adjacent land use and parking needs at interim station locations will also be considered. The amount of parking proposed is determined by forecast station usage. The location of each station, the area served, and proximity to major arterials and/or highways will determine whether parking is recommended at each station. If parking is determined to be advantageous at a proposed station, the ridership forecast for that station will determine the number of parking spaces and the type of parking facility required (e.g. a lot or a garage).

8. Evaluation Criteria Used in the Alternatives Analysis Study

General Comment:

How are screening criteria applied throughout the analysis to advance the alternatives being evaluated?

Pertains to Specific Comments:

6, 8, 57, 58, 72, 96

Response to Overall Category Comment:

A three phase evaluation methodology is being used for the Red Line Extension Alternatives Analysis. With each screen, increasingly detailed and comprehensive evaluation criteria are applied to a decreasing number of alignment alternatives that have been identified as the best potential transportation investments. Each step in the evaluation process is thus designed to increase the level of detailed planning and engineering analysis on progressively fewer alternatives.

In Screen 1, the Alternatives Analysis began with identifying a ‑universe” of alternatives—all of the conceivable transit service improvements that may address the purpose and need for the project within the study area. This universe of alternatives was qualitatively evaluated in Screen 1 using social, environmental, transportation, and economic parameters to identify a shortlist of specific technologies, corridors, and profiles that may best satisfy the project's goals and objectives.

In Screen 2, after identifying the alternatives in more detail, two additional steps of evaluation were performed. In the first step, four factors were used to evaluate each alternative's performance, as follows: physical constraints, such as right-of-way requirements; social and economic factors, using demographics and employment data; environmental factors, including impacts from each alternative on noise, visual, natural and cultural resources; and transportation factors, such as travel time, transit connectivity, and traffic impacts. At the start of Screen 2, eight distinct build alternatives (not including the No-Build and TSM alternatives, which are discussed in more detail below) were considered. Only five of these alternatives advanced after the application of the four evaluative factors used in this first evaluation step.

Next, a more detailed evaluation of the five remaining build alternatives was performed. In this step, preliminary estimates of capital costs, operating costs and projected ridership were used to compare the alternatives. This evaluation was performed with order-of-magnitude estimates to determine which alternatives were most likely to perform well under FTA's cost-effectiveness evaluation criteria. After this evaluation step, three build alternatives remained, as follows: 1) Halsted BRT at-grade, 2) Halsted HRT elevated, 3) UPRR HRT elevated, plus the No-Build and TSM alternatives.

In Screen 3, these advancing alternatives will be evaluated using detailed and quantitative analysis to identify and recommend an alternative to continue as the Locally Preferred Alternative in the study area. In addition to the quantitative cost, ridership, and cost-effectiveness evaluation performed in Screen 3, evaluation of other FTA criteria, such as analyses of transit-supportive land use and local financial commitment are also prepared.

For more information on the evaluation criteria or evaluation results of each alternative, please see the detailed summaries available for review on the Screen 1 and Screen 2 presentation boards, which are available for download at the CTA's website www.chicagotransit.com as noted in the introduction to this document.

Other Specific Comments on Socioeconomic Criteria:

What are the socio-economic factors considered in the Screen 2 analyses and how are they weighted?

Pertains to Specific Comments:

10, 34, 56, 57, 58, 104

Response:

In Screen 2, after identifying the alternatives in more detail, two additional steps of evaluation were performed. In the first step, social and economic factors were considered, among others. Social factors were evaluated by station area: for BRT this included the area within ¼-mile radius of proposed station stops and for HRT, the area within ½-mile radius of proposed station stops. CTA evaluated factors including total population, population density, employment, employment density, number of households, total zero-car households, zero-car household percentage, total minority population, minority population percentage, total poverty-status households, poverty-status household percentage, number of hospitals, and number of schools and colleges. All of these factors were evaluated based on year 2000 data and, where available, forecasts for year 2030. CTA compared BRT alternatives and HRT alternatives separately, due to the differing station radii used for collecting and analyzing data.

For the eight alternatives evaluated, the data did not significantly differentiate one alternative from any other. For example, the analysis reveals there are no significant differences in the current percent of minority populations among the three alternatives. The minority population for all of the corridors considered is approximately 99 percent, which is significantly higher than the minority population in Cook County at 44 percent. Additionally, all corridors include a proportion of households without cars (ranging from 15-25 percent) similar to Cook County at 17 percent. And all corridors have a higher percentage of poverty-status households (17-24 percent) than Cook County as a whole (at 12 percent).

A comparison of the potential impact on hospitals and schools did not reveal significant differences either. One hospital is located within quarter of a mile of the Michigan Avenue Alternatives and each alternative has three to five schools within a quarter mile of station areas. Since all schools were along the neighboring streets rather than on the main routes, with the exception of Harlan High School on the west side of South Michigan Avenue at West 97th Street, they did not weigh heavily on the overall social rating.

All economic factors were evaluated within a ¼-mile radius of both BRT and HRT proposed station stops. Factors included the number of Tax Increment Financing (TIF) Districts, Enterprise Zones and Industrial Corridors as well as an evaluation of retail locations and transit-supportive land use potential and impacts to the revenue of adjacent businesses during construction.

For the eight alternatives evaluated, all of the alternatives were equivalent in the evaluation of economic factors. All of the corridors have adjacent areas belonging to (TIF) Districts, Enterprise Zones and Industrial Corridors. The Halsted Street and UPRR Corridors have five and six noted areas, respectively. The Michigan Avenue Corridor has only two of these areas; however, the Michigan Ave TIF district encompasses nearly the entire corridor.

In the evaluation of average retail locations and transit supportive land uses, note that the corridors that perform best (the Halsted and Michigan Avenue Corridors) are also the corridors most affected during construction – as noted in the subsequent economic factor –Impacts to revenue of adjacent businesses during construction.” All of the corridors have the potential for enhanced economic development in conjunction with the respective alternative.

Transit-oriented development (TOD) is also an important evaluation factor considered by the Federal Transit Administration (FTA). The FTA evaluation of TOD includes existing land use, transit supportive plans and policies, performance and impacts of these policies, and other land use considerations. As all corridors have the potential for enhanced economic development, there are TOD opportunities for all three alternatives. These opportunities will be further defined and documented during the upcoming station area planning work that CTA will perform to support Screen 3.

Other Specific Comments Noted on this Topic:

Comment:

42: …With each possibility (HB, HR, UPR) what would the impact be on decreasing the commute time?
103: Will the extension of the Red Line cut the time of getting to your destination…?

Response:

Reducing travel times is one of the key elements in the stated Purpose and Need of the Red Line Extension Alternatives Analysis study (see Topic 4 for more information about the project Purpose and Need). All of the proposed build alternatives advancing to Screen 3 (Halsted at-grade Bus Rapid Transit, Halsted elevated Heavy Rail Transit, and UPRR elevated Heavy Rail Transit) include improvements to reduce travel times in the Red Line Extension Alternatives Analysis study area.

The Heavy Rail Transit alternatives on Halsted and the UPRR both result in travel time reductions on the bus trips currently used to access the Red Line. Local bus trips would serve the proposed extension station nearest the east-west bus lines, reducing the total number of buses serving the current Red Line

95th Street terminal station. Estimated travel time by rail from 130th Street to 95th Street by rail is approximately 12 minutes compared to 25 minutes or more today.

For the Bus Rapid Transit alternatives, travel times on Halsted, the corridor with the majority of bus trips in the Red Line Extension Alternatives Analysis study area would improve due to roadway improvements such as dedicated travel lines and traffic signal priority. Additionally, this alternative includes reconfiguring the current bus terminal at the Red Line 95th Street terminal station, alleviating some of the congestion approaching and accessing the terminal, although still requiring a transfer for trips beyond 95th Street.

Comment:

88: What exactly would the TSM be for the Red Line Study?
89: What is the Baseline Alternative, and does not BRT come closest to the Baseline Alternative?

Response:

The No-Build Alternative incorporates only those transportation improvements that are included in the 2030 Regional Transportation Plan for which need, commitment, financing, and public and political support are identified and are reasonably expected to be implemented. The second alternative that is developed for consideration is called the Transportation System Management (TSM) Alternative and is defined as the best that can be done for improving mobility without constructing a new transit guideway. The TSM Alternative can include applicable transportation system upgrades such as intersection improvements, bus route restructuring, shortened bus headways, express and limited-stop service, signalization improvements, and timed-transfer operations.

The Federal Transit Administration must approve the definition of the No-Build and TSM Alternatives; however, only one of these alternatives advances as the Baseline Alternative. Because the Baseline Alternative should represents the best that can be done to improve transit service in the study area without major capital investment in new infrastructure, it is often the TSM Alternative that is used as the Baseline Alternative. The Baseline Alternative should be designed to address identified transportation needs in the Red Line Extension study area and demonstrate the extent to which these problems can be solved without a proposed major capital investment.

The definitions and selection of the No-Build and TSM Alternatives – and the alternative chosen as the Baseline Alternative – is the subject of interaction between FTA and CTA Alternatives Analysis study staff and that process is currently underway. When the final alternatives are selected, definition of the specifics of these alternatives will be presented to the public in the next round of outreach, Screen 3. Additionally, measured benefits from the alignment, mode and vertical profile alternatives (or build alternatives) that have advanced from Screen 2 to Screen 3 will be compared with the FTA-required Baseline Alternative. This comparative analysis is a key activity that the FTA uses in their annual rating of New Starts transit projects.

Comment:

101: How much does existing congestion on Halsted factor into evaluating the BRT option for Halsted?

Response:

In Screen 2, after identifying the alternatives in more detail, two additional steps of evaluation were performed. In the first step, transportation factors were considered, among others. Transportation factors were evaluated along the corridor length of each proposed alternative. CTA evaluated factors such as the anticipated travel speed of each alternative, new traffic impediments introduced by the alternative, and potentially displaced parking spaces.

Since the Halsted Street BRT at-grade alternative assumes that a dedicated lane exists for the BRT vehicles, average travel speed was derived from known travel speeds in other BRT corridors operating in similar conditions – and was not negatively impacted by existing congestion on Halsted Street. The Halsted Street impacts to traffic in general purpose lanes and parking displacement will be assessed in more detail in Screen 3.

9. Ridership Estimates and Related Issues

General Comment:

How were ridership numbers generated? What is the projected ridership on each corridor?

Pertains to Specific Comments:

40, 55, 66

Response to Overall Category Comment:

As required by FTA guidance, CTA is working in cooperation with other regional transportation agencies and the Chicago Metropolitan Agency for Planning (CMAP) to develop a regional travel forecasting computer model that can be used to predict ridership for the various alternatives being studied using information on projected population, employment, congestion, and other factors. This computer model is based on other models already used by CMAP for other regional transportation planning purposes.

In Screen 2, after identifying each alternative in more detail, two steps of evaluation were performed. In the first step, four factors were used to evaluate each alternative's performance including physical constraints, social and economic factors, environmental factors, and transportation factors. (More detail on the evaluation process is provided in Topic 8.) At the start of Screen 2, eight distinct build alternatives, plus the No-Build and TSM alternatives (also discussed in more detail in Topic 8) were considered. Only five of these build alternatives advanced after the application of the four evaluative factors used in this first evaluation step.

Next, in addition to other evaluation criteria, preliminary ridership estimates were developed for each alternative that advanced to the step 2 evaluation of Screen 2. The ridership model requires calibration with current day transit volumes in order to validate the forecasting outputs. This calibration had not yet been completed in detail at the completion of Screen 2; therefore, the ridership volumes produced by the model are only conceptual estimates and can only be referenced for order-of-magnitude comparisons. However, these estimates suggest that the rail alternatives on the Halsted Street and UPRR Corridors are similar in scale. Additionally, the estimates suggest that the rail alternatives have a ridership volume that is about three times higher than BRT ridership estimates. Specific ridership estimates from the calibrated model will be produced for the Screen 3 and will support the recommendation of a Locally Preferred Alternative.

10. Project Cost Estimation

General Comment:

Please describe the project cost estimating process and how these estimates are used to make decisions regarding alternatives advanced in the study. What are the current estimates for each alternative?

Pertains to Specific Comments:

8, 28, 31, 33, 61, 84, 92, 93

Response to Overall Category Comment:

Constructing transportation facilities, purchasing transit vehicles, providing new transit services, and maintaining existing services require a significant financial commitment. Transit capital investments can last several generations and can require continuing public financial support for maintenance and operations. FTA guidelines require that all of these factors must be considered when evaluating the feasibility of an alternative and in determining which alternatives advance for more detailed analysis.

In Screen 2, the costs used in the analysis were preliminary and conceptual in many cases, based on general knowledge of the costs associated with each alternative being evaluated. For example, in the comparison of the underground versus elevated HRT alternatives on Halsted Street, experience from projects in other U.S. cities indicates that underground HRT in this context would cost two to three times as much as elevated HRT, but would yield comparable benefits—such as capacity and travel times. As a result, although highly detailed and precise economic costs regarding the expenses to create an underground or elevated HRT alternative were not determined (and are not appropriate at this stage), underground HRT was not advanced to Screen 3 because the identified economic factors strongly indicated that there would be higher costs for the underground HRT system with little or no advantage over an elevated HRT system.

This order-of-magnitude analysis was performed on all alternatives advancing into the second evaluation phase of Screen 2 (see Topic 8 for more information about evaluation criteria). Alternatives were compared with each other to determine which would advance into the more detailed capital costing performed in Screen 3. CTA analysis determined that the Halsted Street BRT at-grade alternative rated favorably compared with others under consideration and will be advanced to Screen 3. As mentioned, the Halsted Street HRT underground alternative and the UPRR HRT trench alternative performed poorly compared with other alternatives, as their costs are expected to be much higher than other HRT alternatives. Finally, while these order-of-magnitude estimates suggest that the UPRR HRT elevated alternative would be more expensive than the Halsted Street HRT elevated alternative due to over a mile more in infrastructure costs, both of these alternatives rated favorably compared with different vertical profiles on the same corridors (the trench and underground alternatives, respectively) and will be advanced to Screen 3.

The upcoming Screen 3 analysis will examine capital and operating costs in more detail as well as how the various cost factors apply to the alternatives being considered. In Screen 3, the reduced number of alternatives creates a manageable set of alternatives to be examined in detail. In accordance with FTA guidance, the analysis in Screen 3 will include a capital cost comparison, an operating and maintenance cost comparison, as well as a comparison of the estimated annualized cost per boarding.

Other Specific Comments on this Topic:

Comment:

8: Subways are cost prohibitive? Why? Are the cost constraints the CTA's or the Federal governments?

Response:

There are no local or federal constraints on the project cost. However, since the Red Line Extension and other projects in Chicago are competing with other cities across the country for a limited amount of federal funding to advance into Preliminary Engineering and Environmental Impact Statement project phases, CTA works to keep all of its projects competitive. The current FTA measure of competitiveness is the project cost-effectiveness rating, which compares project cost with estimated user benefits. The project must provide high benefits (measured in terms of new riders and travel time savings) for the people using the facility for the least amount of cost to remain competitive against projects in other cities.

Screen 2 analyses estimated that the cost of building a subway on the Halsted Street corridor in the Red Line Extension Alternatives Analysis study area would be two to three times the cost of an elevated structure in the same corridor. However, while the cost of a subway line is much higher than an elevated structure, the level of service and travel time savings provided by both are identical. Additionally, since the evaluation analyses to advance alternatives are comparative, the subway alternative did not perform as well as the elevated alternative on the Halsted Street corridor.

Comment:

79: Is it true that the greatest financial benefit to the CTA would be through the selection of the UP route even though the initial cost might be more?

Response:

It is too early to tell which alternative will have the greatest financial or ridership benefits. The Screen 3 evaluation process will develop ridership forecasts based on computerized travel models, and more detailed estimates of capital and operating costs associated with the remaining alternatives. Therefore, at the end of Screen 3, the CTA will be able to address this question. It is important to note that all proposed alternatives are expected to require public financial support for construction, operation, and maintenance.

11. Funding of Red Line Extension Construction and Operations

General Comment:

How will the construction and operation of the Red Line Extension be funded? How are matching funds secured? How is the Red Line Extension funding related to transit fares?

Pertains to Specific Comments:

18, 23, 32, 37, 54, 67, 69, 76, 108

Response to Overall Comment Category:

CTA's operating budget supports day-to-day operations and helps determine the service frequency and hours CTA can offer on its bus and rail system. Half of CTA’s operating budget comes from customer fares and revenue generated from sources such as advertising and concessions. The other half of the operating budget comes from regional sales taxes and matching funds from the State of Illinois. No federal funds are available specifically to cover operating expenses. Once the Red Line Extension is built and operational, the funds to operate the system will come from fare revenue as well as local and state funding sources, consistent with the funding mechanisms that support CTA’s other bus and rail transit services.

Meanwhile, CTA’s capital funding is provided both by the federal government and State of Illinois and is granted specifically for improvement projects such as rail station renovations, track and structure rehabilitation, bus and rail car purchases, and rail extensions. It is federal capital funding that is being sought for the Red Line Extension and other New Starts projects. Capital funds help the CTA maintain and improve its service, but federal rules prevent its use for day-to-day operations expenses.

CTA has initiated this Alternatives Analysis study for the Red Line Extension as a first step towards obtaining capital funding for the project through the Federal Transit Administration’s ―New Starts” grant program.[3] This program provides funding for major public transit infrastructure projects throughout the U.S. through a highly competitive process. Upon successfully advancing through the four phases of project implementation (Alternatives Analysis, Environmental Impact Statement, Preliminary Engineering, and Final Design) a project will be qualified to receive a ―Full Funding Grant Agreement” (FFGA) from the U.S. Government. The amount of funding in the FFGA covers up to 80 percent of the project’s capital costs. Other federal, state and local funds comprise the remainder of capital funding. It is possible to seek alternative sources of federal and non-federal funding for the project, but the federal New Starts grant program is specifically intended to support transit projects of this nature and is the public funding mechanism generally most capable of doing so.

As indicated above, to ultimately secure federal New Starts grant funding, matching funds for at least 20 percent of the project’s capital costs are required from sources other than the New Starts grant program mainly from non-federal (i.e., state and local) sources. From 2000 through 2004, the Chicago region’s matching funds came from the State of Illinois through the Illinois FIRST legislation. The Illinois FIRST legislation expired on June 30, 2004. Since that time, CTA has been working with the Illinois Legislature to enact a replacement to Illinois FIRST and ensure that all future federal transit funds available to the Chicago region can be fully utilized.

CTA is simultaneously pursuing solutions to its overall operating and capital funding challenges while also positioning itself (through Alternatives Analysis studies such as this one) to secure capital funding to meet the region’s future transit infrastructure needs. While it is necessary and critical for CTA to obtain the capital and operating resources it needs to maintain its system in a state of good repair on an ongoing basis, it is equally important to plan for the future; there is little value in maintaining an existing system if it will not adequately address future travel needs. CTA’s overall Capital Improvement Program not only identifies funding needs to maintain the existing system in a state of good repair, but it also identifies and addresses future needs to serve growing regional transit travel demands. With a growing population and shifting travel patterns and travel needs, it is important to anticipate CTA customers’ future needs and plan accordingly. For example, many of today’s key transit links—including the Blue Line to O'Hare and the Orange Line to Midway—were made possible by past generations who understood the need to invest in transit's future even as they addressed significant day-to-day financial pressures.

---

[3] CTA is also conducting concurrent Alternatives Analysis studies for other candidate New Starts expansion projects that have been authorized by the U.S. Congress—including extending the Yellow Line to Old Orchard, extending the Orange Line to Ford City Mall, and the constructing the Circle Line.

It is also important to recognize that federal capital funding for transit system expansion projects comes largely from the New Starts grant program funds that are allocated separately from federal formula funds dedicated to ongoing "state of good repair" capital improvements. While federal formula funds may be used for infrastructure renewal projects, New Starts funds are discretionary funds that can only be used for system expansions. Given that CTA has demonstrated need for both formula and New Starts funding, it is prudent that CTA take all necessary steps to obtain funding from both sources and not focus on just one while passing up the other. CTA does not propose diverting its federal formula funds to support system extensions and expansions.

See Topic 10 for more information about Red Line Extension project costs.

12. Alternatives Analysis Public Involvement Process and Format

General Comment:

Does the public involvement process for the Red Line Extension Alternatives Analysis study allow individuals to have a voice in the decision in the corridor selection? Is all the information (evaluation criteria, etc.) available to the public? When will the next round of meetings be held?

Pertains to Specific Comments:

2, 4, 11, 16, 20, 21, 36, 40, 63, 64, 86, 106,107,119

Response to Overall Category Comment:

Public involvement is a key component of this process. The outreach has already begun including a community stakeholders meeting with representatives and leaders of various community groups throughout the study area. We also have offered to meet with all elected officials representing the Red Line Extension study area and adjacent areas. Meetings also included faith-based organizations, other community organizations, and city and state agencies such as the Chicago Department of Transportation, Illinois Department of Transportation, Regional Transportation Authority, Metra, and Pace. If your organization would like to be included in the stakeholder's meetings please contact Darud Akbar, CTA Government and Community Relations at dakbar@transitchicago.com.

The public involvement process for the Red Line Extension Alternatives Analysis study also includes a total of six public involvement meetings, two each at the conclusion of the Screen 1, Screen 2, and Screen 3/LPA analyses. The Screen 1 meetings were held at Chicago State University and West Pullman Public Library. The Screen 2 meetings were held at the West Pullman Historic Visitors Center and the Woodson Regional Public Library. Meeting locations for Screen 3 have not yet been determined nor have the dates; however, CTA anticipates that meetings will be held in summer 2009. The meeting locations must be close to public transit and accessible to people with disabilities. Suggestions for meeting locations may be sent to Darud Akbar, CTA Government and Community Relations at dakbar@transitchicago.com.

Meetings are announced through ads in neighborhood newspapers and publications as well as public alerts on CTA trains and buses, at rail stations, on the CTA Web site, and distributed to print and broadcast media via news releases. The Screen 2 outreach meeting information was posted in The Chicago Defender (Nov. 12 & 19), The Crusader (Nov. 13), La Raza (Nov. 23rd), and the Daily Southtown (Nov. 20th). In addition to the CTA website, information was posted on at the websites for the Regional Transportation Authority and the Chicago Metropolitan Agency for Planning. Notices were distributed to elected officials and surrounding suburb's village halls for distribution and posting.

The format of the meetings included groups of presentation boards containing detailed information on each area of analysis in the study, where individual conversations between the public and project staff knowledgeable about that area of analysis could take place. The public meetings also included a community presentation that provided information in a slideshow format led by the study's project managers (available at www.transitchicago.com). Meeting attendees were requested to submit questions and comments in a written format. CTA's goal in emphasizing written questions and comments has been to ensure everyone's thoughts are collected and reviewed, rather than only those individuals who might choose to speak publicly at a meeting. The intent has been for everyone to have an equal opportunity to participate in the process. In addition, by reviewing and responding to similarly worded questions, the presenters efficiently addressed multiple individuals at once and avoided repetition during the public meetings. CTA and the consultant team staff have also been available to answer any individual questions on a one-on-one basis following the general question and answer period at each meeting. All of the meeting materials are available at the CTA's web site (www.transitchicago.com).

The written comments received at the public meetings and other detailed comments submitted subsequently are being answered individually for the record in the format of this document, which will be made available publicly on the CTA web site, by email to public meeting participants, and in hard copy by written request. All of the comment cards and other written communications (primarily emails) will collectively become part of the evaluation process and will be submitted to the Federal Transit Administration as a part of the official documentation for the Alternatives Analysis study.

13. Potential Red Line Extension Economic and Environmental Impacts

General Comment:

What will be the economic and environmental impacts of the Red Line Extension? What will be the community and economic benefits of the Red Line Extension? How are specific impacts and benefits measured and valued?

Pertains to Specific Comments:

4, 5, 34, 56, 57, 58, 85, 91, 102, 104, 105

Response to Overall Category Comment:

An Environmental Impact Statement (EIS) will analyze in detail the social, economic, and environmental consequences and benefits of the proposed Red Line Extension. The environmental review process required by the *National Environmental Policy Act* of 1969 (NEPA) and related laws includes environmental impact analyses and the preparation of documentation for public review. Per FTA guidance, the environmental evaluation begins upon completion of the Alternatives Analysis study, and it will result in a detailed written statement on the anticipated environmental impacts of the Red Line Extension and the steps that will be taken to mitigate any negative impacts to the community and the natural environment.

Typically, environmental reviews for proposed transit projects address the potential impact areas of air and water quality, noise and vibration, historic and cultural properties, parklands, contaminated lands, displacement of residences and businesses, and community preservation. During the federal environmental review process, the CTA will work concurrently with state and other local agencies to also comply with state and local environmental laws.

As part of the preparation of an Environmental Impact Statement, the traffic and parking impacts of the proposed transit improvements – at key intersections, at proposed terminal locations, and throughout the study area – will also be evaluated in more detail. Depending on the Locally Preferred Alternative (LPA), local bus routes may be reduced or reconfigured. Where necessary, CTA coordinates with the Illinois Department of Transportation and local municipalities when evaluating traffic issues. Maintaining traffic flow and related efficiencies is a major consideration in CTA's planning of this extension.

Prior to initial engineering work which outlines specific infrastructure needs in coordination with available right-of-way and current land uses, CTA cannot determine how much private property, if any, would need to be acquired in order to construct and operate the selected alternative. A final determination on the vehicle technology, alignment and vertical profile will need to be established before potential property impacts can be assessed. Potential property impacts are determined in detail as a part of the Preliminary Engineering (PE) phase of project development, which proceeds concurrently with the preparation of the EIS. Public acquisition of private property is governed by federal and local laws. In accordance with these laws, affected property owners would be compensated for their properties based on fair market values and can be provided relocation costs.

Regarding the economic impact of the Red Line Extension, FTA guidance requires an economic analysis of the Red Line Extension to be conducted as a part of Screen 3 of the Alternatives Analysis. In general terms, it may be noted that numerous studies suggest that transit investments result in economic development. A recently conducted study by the U.S. Department of Transportation, found that for every $1 billion invested in transit projects, 47,500 jobs are created or sustained. Specific projections for the Red Line Extension may be developed in later studies. Currently, CTA is working with the Mayor's Office of Workforce Development to ensure that training and jobs access will be available to support the construction of the proposed Red Line Extension.

Other Specific Comments on this Topic:

Comment:

9: Bus pollution of BRT, how will it be mitigated?

Response:

CTA anticipates that any BRT alternatives would use hybrid diesel-electric powered or use alternative fuels-based vehicles. Alternatives fuels could include compressed natural gas, clean diesel technology engines, and/or low sulfur fuel. New technologies, such as fuel cell powered buses are also being developed. All of these options have lower pollution than regular diesel fuel vehicles; however, the potential pollution impacts of any vehicle decision will be further evaluated during the subsequent Environmental Impact Statement project phase. Mitigation strategies, if necessary, would be developed at that time.

14. Potential Red Line Extension Impacts on Existing CTA Services

General Comment:

How would the Red Line Extension impact current CTA services? Will there be redesign or expansion to the existing 95th Street terminal station?

Pertains to Specific Comments:

15, 102, 116

Response to Overall Category Comment:

It is anticipated that the structure of existing bus routes in the study area will be changed to complement new high-capacity transit service. Depending on the specific alternative advanced as the Locally Preferred Alternative, the number of bus routes feeding into the 95th Street Red Line station may change. Changes to bus services will be subject to public input and will be implemented after construction.

The use of the air rights over the Dan Ryan Expressway has been considered for expanding the 95th Street Red Line station facility. This type of expansion is very costly and must be weighed against the needs and benefits of expanding the station facility. The Red Line Extension HRT alternatives – including the Halsted Street HRT elevated and the UPRR HRT elevated alternatives – would reduce the number of buses feeding the 95th Street station, while the Halsted Street BRT at-grade and Transportation System Management (TSM) alternatives (more information about these alternatives is available in Topic 8) would result in an increase in the number of buses serving the 95th Street station. During Screen 3, the potential for expanding the 95th Street station facility will be examined as part of the Halsted Street BRT and TSM alternatives. The Screen 3 evaluation and subsequent engineering design phases will determine the necessity for any significant redesign of the 95th Street station based on proposed bus routing changes that affect the terminal.

Other Specific Comments on this Topic:

Comment:

53: Would the 111/115 Pullman Route return to a "shuttle like" route whenever an alternative is chosen?

Response:

Route 111 Pullman/111th Street/ 115th Street bus may be restructured if it results in a simplified route paths and better service to the proposed alternative. The Screen 3 evaluation will include the development of preliminary service plans for the alternatives that would identify any anticipated changes to the bus route.

15. Other

General Comment:

This section includes general comments and viewpoints that can be characterized as public input into the study process.

Pertains to Specific Comments:

2, 48, 49, 62, 129

Response to Overall Category Comment:

These comments do not ask a question or refer to a specific issue, but rather point out general views on the subject, which have been noted. Thank you for your feedback.

Other Specific Comments on this Topic:

Comment:

35: Which projects are being driven by the 2016 Olympics?
39: Is the Red Line- rather the advancement of the project being driven by 2016 Olympics?

Response:

CTA is working closely with the 2016 bid team and believes that the present transit system can handle transit needs for the 2016 Olympics. The Red Line Extension project is not linked with Chicago's bid for the 2016 Olympics. However, any improvements made to the current system could only benefit the City's Olympic candidacy.

Comment:

75: What effect does the Canadian National's RR purchase of the EJ&E RR and subsequent rerouting of freight trains in suburban & city areas have in the final consideration?

Response:

This purchase does not affect any of the alternatives under consideration in the Red Line Extension Alternatives Analysis study.

Federal Transit Administration’s
New Starts Process

Red Line Extension Alternatives Analysis Study

June 2009

Schedule for Tonight’s Meeting

- **Structure of the meeting**
- **Questions and answers process**
  - Submit your comments in writing on comment cards
  - Comments and questions will be grouped and answered by topic
  - All comments and questions will be addressed on CTA’s website - www.transitchicago.com
  - An interpreter for the hearing impaired and a translator for the Spanish speaking community are available this evening

Screen 3 Public Meetings

Wednesday, June 3, 2009	Thursday, June 4, 2009
6:00 pm - 8:00 pm (Presentation begins at 6:15 pm) Olive-Harvey College Cafeteria 10001 S. Woodlawn Ave. Chicago, IL	6:00 pm - 8:00 pm (Presentation begins at 6:15 pm) Woodson Regional Chicago Public Library 9525 S. Halsted St. Chicago, IL

Tonight's Speakers

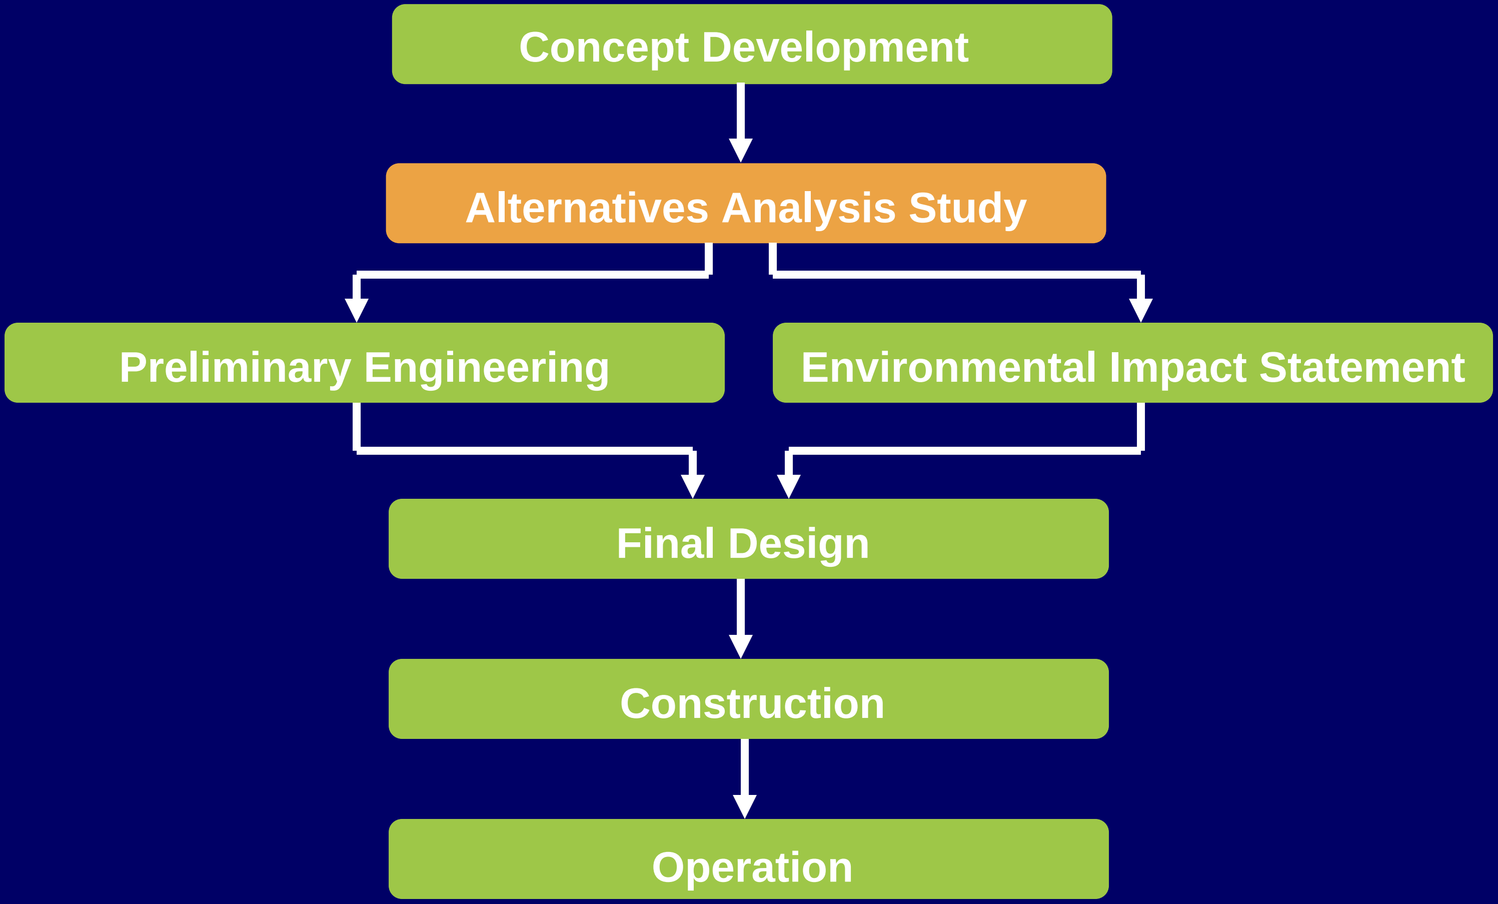
- **Darud Akbar – Moderator**
  - Chicago Transit Authority
- **Jeffrey Busby – Strategic Planning Manager**
  - Chicago Transit Authority
- **Ronald Shimizu – Red Line Study Area Manager**
  - Parsons Brinckerhoff

Outline of the Presentation

- Discuss Status of Red Line Extension Alternatives Analysis Study
  - New Starts Overview
  - Prior Findings
- Screen 3 Preliminary Findings
- Public Involvement Process

Status of Study

FTA’s Required New Starts Process



Concept Development

Alternatives Analysis Study

Preliminary Engineering

Environmental Impact Statement

Final Design

Construction

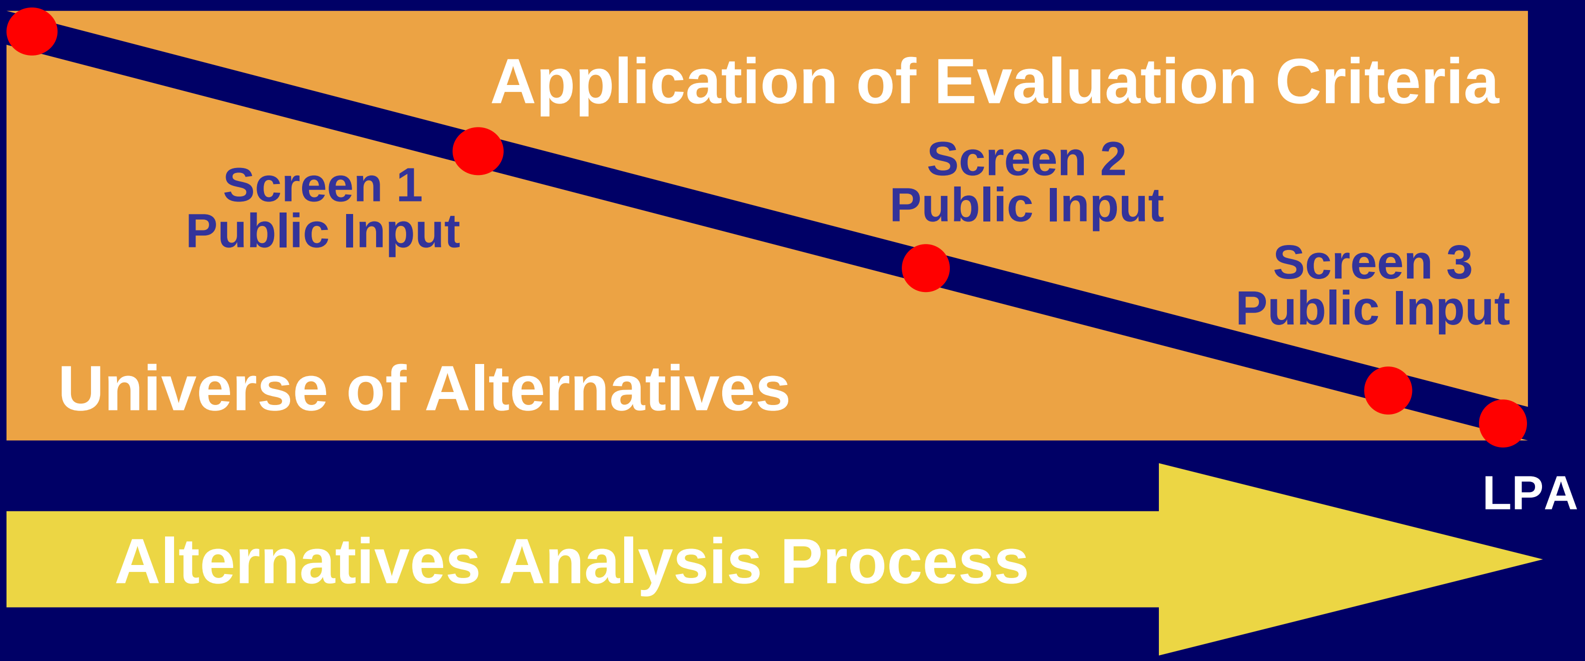
Operation

Alternatives Analysis (AA) Studies

- FTA Requirement for federal funding for transit expansion (New Starts)
- Identifies transit opportunities and ensures all practical solutions are considered
- Ensures planning is consistent among all New Starts projects throughout the country
- Provides opportunity to gather information and receive public input
- Identifies Locally Preferred Alternative

FTA Evaluation Process

The Purpose and Need is first defined, the evaluation criteria are applied, and options within the Universe of Alternatives are eliminated until at the end of the process, there is a Locally Preferred Alternative (LPA).



Application of Evaluation Criteria

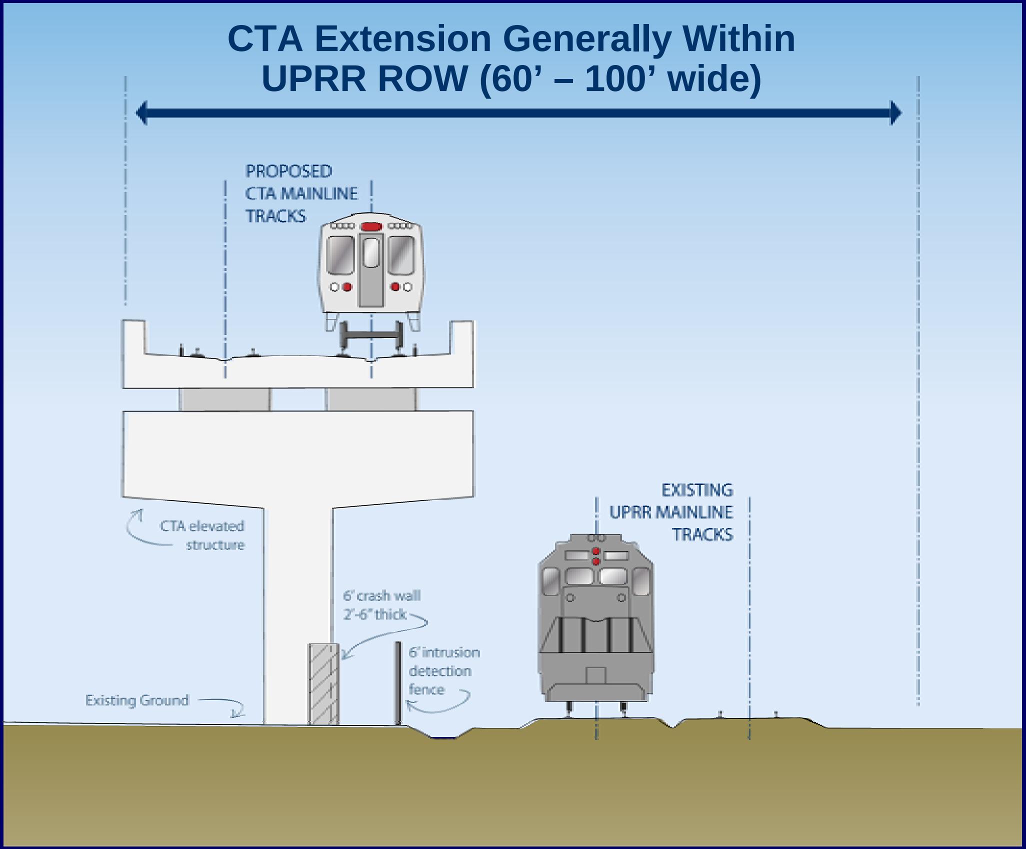
Step 2 – Detailed Evaluation

- **Evaluation Factors**
  - Physical Constraints
    - Right-of-Way Requirements
  - Public Support
    - Public Meeting Comments
    - Referendum
  - Social/Economic Factors
    - Demographics
    - Employment
  - Environmental Factors
    - Noise, Visual, Natural and Cultural Resources
  - Transportation Factors
    - Travel Time, Transit Connectivity and Traffic
  - Capital Cost
  - Operating & Maintenance Cost
  - Ridership Potential
  - Cost Effectiveness

Physical Constraints

- **Freight Railroad & Transit Shared-Use Corridor**
  - Due to recent accidents, the transportation industry is adopting greater separation between freight railroad and transit operations for safety reasons
  - For the UPRR Rail Alternative, 50-feet separation distance is desired from freight railroad tracks
- **Right-of-Way Constraints**
  - UPRR needs most of their right-of-way for operational purposes
  - With additional separation distance, CTA extension will be immediately adjacent (east or west) of the UPRR right-of-way and will require adjacent property acquisition

UPRR Rail Alternative – Within UPRR ROW



CTA Extension Generally Within UPRR ROW (60' – 100' wide)

Public Support

- 340 comments were received in Screens 1 & 2 -- 99 of those expressed a preference for a particular alternative
- 87% of these comments were in favor of the UPRR Rail alternative and 7% were in favor of the Halsted Rail alternative
- In a November 2004, 38,000 residents in the 9th and 34th wards supported a public referendum for the Red Line Extension along the UPRR Corridor

Next Steps

Next Steps

- Incorporate public comments
- Continue railroad discussions and cost-effectiveness evaluation
- Review findings with FTA
- Final recommendation on LPA
- CTA Board to approve LPA
- Ongoing public involvement
  - Sign-in cards will be used to create a contact list to send notices and updates
  - Project updates on CTA web site - www.transitchicago.com

Questions and Comments

- CTA representatives are available to answer additional questions
- Written comments and questions accepted through June 18, 2009

Construction

Operation

Purpose and Need

Transportation Needs

- Significant bus and passenger congestion at 95th Street Red Line Station
- Lengthy bus trips to access 95th Street Red Line Station
- Far South Area residents experience 20% longer commute than rest of City
- Traffic congestion is expected to grow along with study area population and employment

Opportunity for Improvement

- Extend rapid transit service south from 95th Street Red Line Station
- Improve access to, within, and beyond study area
- Stimulate economic development and job opportunities
- Shorten transit travel times through faster and more direct routings

Red Line Extension
Alternative Analysis Study

Community Participation

Community participation is one of the key components of the alternatives analysis.

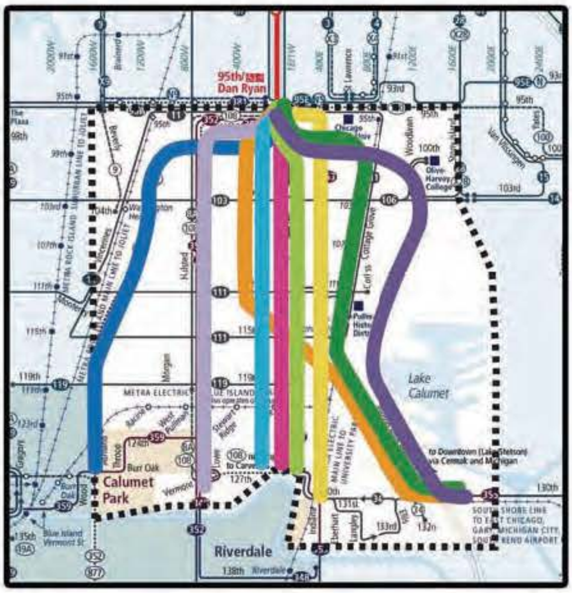
Community Outreach

- General Public
- Elected and Appointed Officials
- Community and Civic Organizations
- Faith-Based Organizations
- City and State Agencies

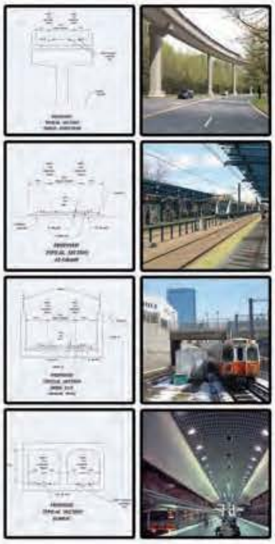
Ongoing Public Involvement/Input

- Meetings announced through public notices and advertisements
- Project updates on the CTA web site: www.transitchicago.com, accessible at local public libraries

Universe of Alternatives



95th/Dan Ryan
Lake Calumet
Calumet Park
Riverdale
to Downtown (Lake/Stetson) via Cermak and Michigan
South Shore Line to East Chicago, Gary, Michigan City, South Bend Airport



Technologies

- Automated Guideway / Monorail
- Bus Rapid Transit
- Commuter Bus
- Commuter Rail
- Heavy Rail
- High Speed Rail
- Light Rail
- Local Bus
- MagLev
- Personal Rapid Transit
- Streetcar

Corridors

- ● I-57 Expressway
- ● Halsted Street
- ● UP Railroad
- ● Wentworth Avenue
- ● State Street
- ● Michigan Avenue
- ● King Drive
- ● Cottage Grove / Metra Electric
- ● I-94 Bishop Ford Freeway

Profiles

- Elevated
- At-Grade
- Trench
- Underground

Red Line Extension
Alternative Analysis Study

Preliminary Cost-Effectiveness Evaluation

FTA has cost-effectiveness thresholds

- Cost per hour of projected user benefits as measured by travel time savings.

Shorter versions of the HRT alternatives were investigated to see if the cost-effectiveness improved:

- HRT Halsted to 119th Street
- HRT UPRR to 115th Street

Initial results indicate up to 23% improvement in cost-effectiveness due to greater proportion of capital and O&M cost savings versus ridership reductions.

Factor *	HRT Halsted		HRT UPRR	
	Vermont Avenue	119th Street	130th Street	115th Street
Capital Costs (YOE)	$1,100M	$900M	$1,100M	$800M
O&M Costs (Annual)	$21M	$17M	$24M	$17M
Ridership (Annual)	11.6M	10.9M	12.7M	10.6M
YARD and Shop Costs (YOE)	$200M	$200M	$200M	$300M

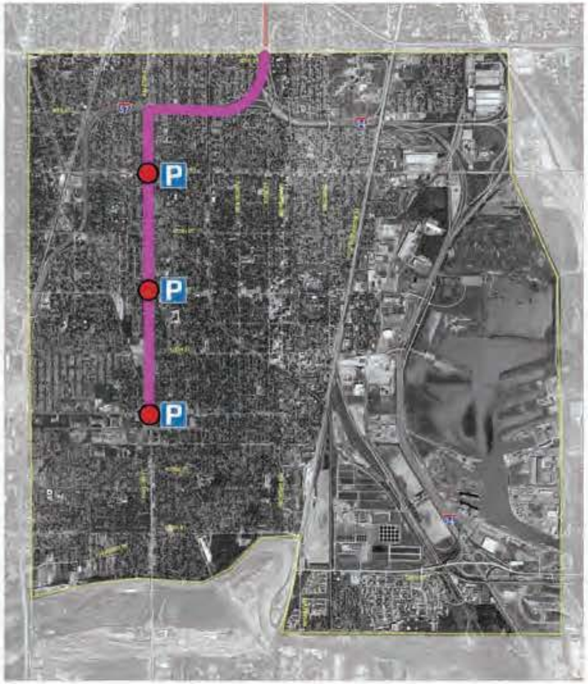
The Halsted 119th Street alternative improves cost-effectiveness by 23%

The UPRR 115th Street alternative improves cost-effectiveness by 22%

* Costs and ridership figures as of June 2009

Preliminary Cost-Effectiveness Evaluation Shortened Alignments

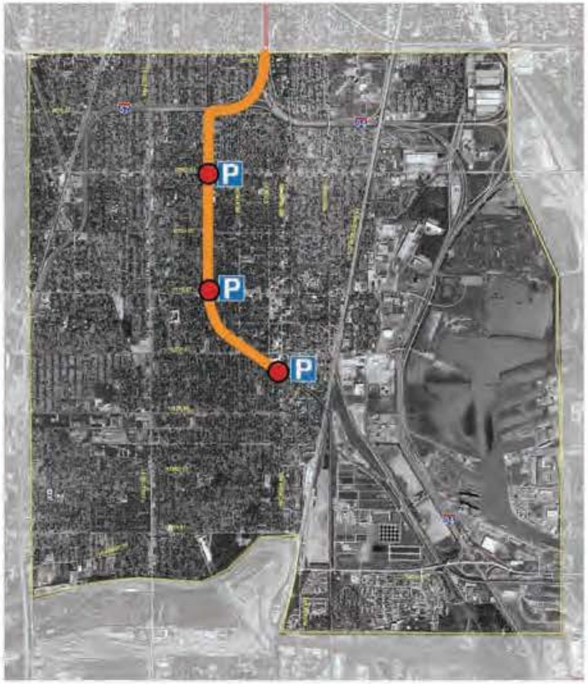
Heavy Rail Transit



Halsted Street to 119th Street

T Elevated

4 Stations / 3.8 Route Miles



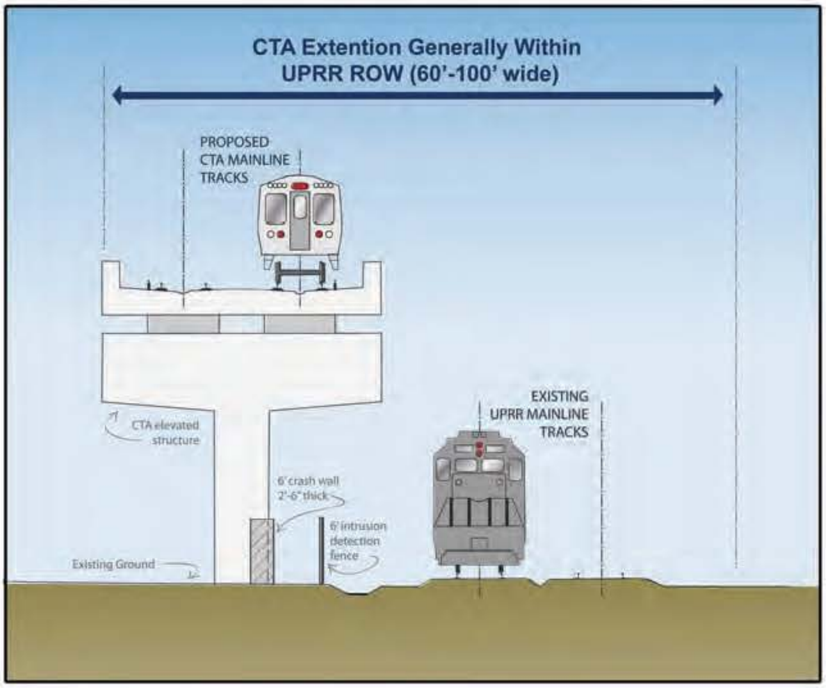
UP Railroad to 115th Street

T Elevated

4 Stations / 3.3 Route Miles

Corridors and stations and parking P are shown in generalized locations only.

Freight Railroad & Transit Shared Use Corridor



CTA Extention Generally Within UPRR ROW (60'-100' wide)
PROPOSED CTA MAINLINE TRACKS
CTA elevated structure
6' crash wall 2'-6" thick
6' intrusion detection fence
Existing Ground
EXISTING UPRR MAINLINE TRACKS

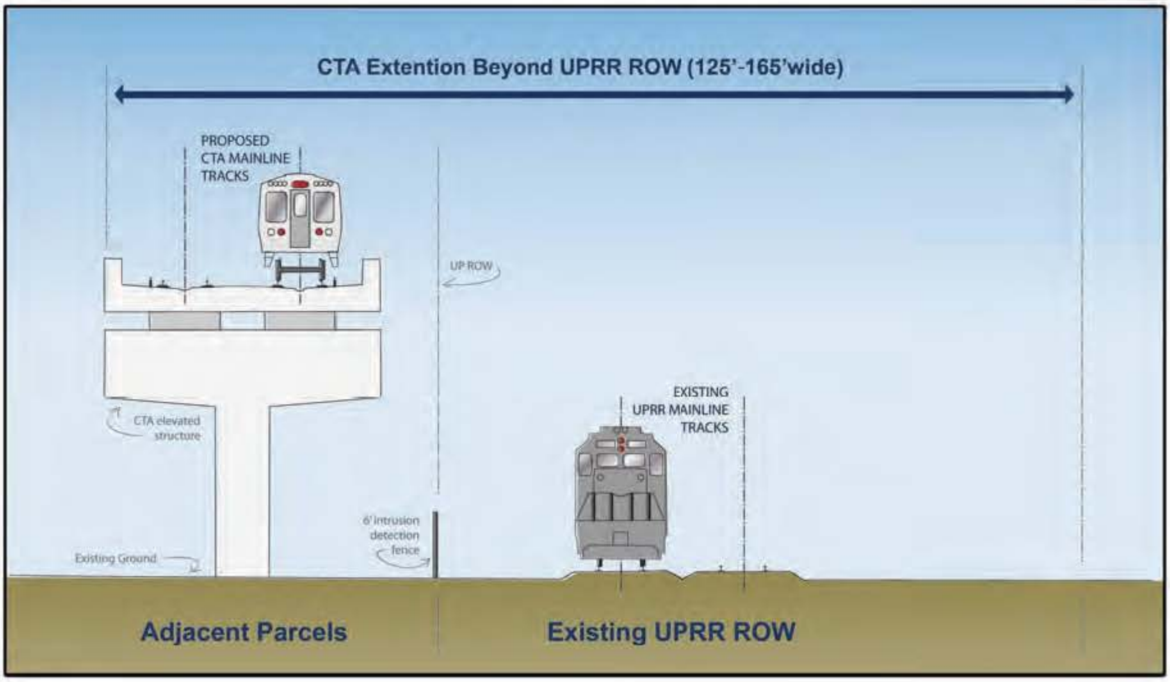
Physical Constraints

Freight Railroad & Transit Shared-Use Corridor

- **Due to recent accidents, the transportation industry is adopting greater separation between freight railroad and transit operations for safety reasons**
- **For the HRT UPRR Elevated Alternative, 50-feet separation distance is desired**

Right-of-Way Constraints

- **UPRR needs entire right-of-way for operational purposes**
- **With additional separation distance, CTA extension will require adjacent property acquisition**
- **East and west alignments immediately adjacent to the UPRR right-of-way are being investigated**



CTA Extention Beyond UPRR ROW (125'-165'wide)
PROPOSED CTA MAINLINE TRACKS
UP ROW
CTA elevated structure
Existing Ground
6' intrusion detection fence
EXISTING UPRR MAINLINE TRACKS
Adjacent Parcels
Existing UPRR ROW

August 2009

No.	Comment/Question	Received Via*	Topic Area(s)
1	Planning Committee with CTA/City of Chicago Community leaders to develop & implement economic development impact.	STK	10
2	Planning Committee with CTA/City of Chicago Community leaders to develop & implement economic development impact.	STK	10
3	Will there be any plans to ensure that while the new business are welcomed what mechanisms will be in place to ensure existing businesses are not displaced; homeowners are not negatively impacted via noise abatement and a sharp rise in real estate taxes.	STK	10
*4 (4-6)	How much parking space will be provided at stations?	STK	6
5	Sense of insecurity is a BIG issue on Red Line. How will this be addressed on trains/stations and in new designs?	STK	10
6	How will presence of UP trains at grade affect travel time for passengers accessing Red Line stations?	STK	4
7	What type of security will you provide for passage. At ground level, have pedestrian bridge.	STK	10
8	If the terminal station that would extend to 130th Street is not selected, what alternatives will be available for the potential patrons who live beyond 103rd and 127th for the other alternative stations or plans?	STK	3, 11
9	Development of 130th would bring new "economic development" to a region of the city. This would greatly improve the overall economic structure of the area.	STK	10
10	What considerations have been given to the development of jobs once he construction starts?	STK	10
*11(11-12	Has the improvement if the 95th Street station include going south on 95th Street and extend over the rail right-of-way on the southside of the street? Also, has it been considered to look at the separation of the bus terminal from the ridership to move the bus stations to the south? Can a pedestrian bridge be added? (across 95th St)	STK	3
12	Consider pedestrian bridges for the access of UR rail & rapid transit for passengers/riders. Are there schematics of this?	STK	4
13	Inter-governmental and inter-agency coordination should now be put into action. A project this large and comprehensive needs the cooperation and input from many levels/layers of government, and city agencies- Planning, environmental, transportation, and economic development with CTA. This has been and can be done and certainly should be done.	STK	9
14	How long would it take for the increased ridership on the Red Line Extension to pay for the cost of the extension-if ever.	OLIVE	8
*15(15-17)	I agree with the recommendation to extend the Red Line using the UPRR to 130th St plan.	OLIVE	13
16	How will CTA acquire the match required by the federal government?	OLIVE	8
17	What type of green technologies are being considered for construction of the Red Line?	OLIVE	12
18	If service was increased on the Metra Electric line, in the grey line proposal, why couldn't business be diverted from 95th Street to closer Metra Electric stations.	OLIVE	2
19	In the 1960's when the Dan Ryan line was built ridership went down 75% on parallel Metra Electric stations. If the same is to happen here wouldn't the goals of better transit access be best accomplished by increasing frequency on the Metra Electric.	OLIVE	2
*20(20-21)	Since the money for this project will be included in the general transportation project, what priority will the Red Line extension be given? Is it mainly a matter of getting on the books while other projects are completed?	OLIVE	2, 8
21	Will tomorrow's meeting have the same info as this one?	OLIVE	9
22	Does funding from federal sources, e.g., Omnibus Budget earmarks, have to have state & local matches?	OLIVE	8
23	I understand that the CTA as an organization does not consider any of the proposed rail projects. If limited funds are available, what factors will influence where the funds are directed?	OLIVE	2

No.	Comment/Question	Received Via*	Topic Area(s)
24	How often does UPRR run through the Red Lines extension corridor?	OLIVE	4
25	Can the land east of the UP south of 119th be used to shorten the line & bring it to grade sooner?	OLIVE	3
*26(26-28)	Why not use MWRDGC vacant land @ 130th for park & ride?	OLIVE	3, 6
27	Can an intermodal at both station be added to the south east metra line (proposed)? And reestablish the Wildwood Station on Metra Electric at 130th?	OLIVE	2
28	What is the travel time 130th to Madison?	OLIVE	5
29	Would like you to send me a print copy of your power point presentation. Print copies (reduced) of display cards.	OLIVE	9
30	Will there be public involvement in the Environmental Impact Study? If so, how will that public involvement be conducted?	OLIVE	1, 10
31	Does the public get to comment on the cost-effectiveness option to only built the Red Line Extension to 115th St.?	OLIVE	9
32	Will there be a bidding process for the Preliminary Engineering? If so, when will that process begin?	OLIVE	1
33	Who will compose the Project Management team during the Preliminary Engineering phase? Is there a place for community on the project management team?	OLIVE	1
34	The grade crossing next to stations seem like a danger for car/pedestrian alike. Why not build at-grade and use the savings to build underpasses of both CTA and UPRR?	OLIVE	3, 4, 12
35	How will the Halsted Street bus or train benefit the passengers who don't live west? Yes its beneficial to hose who live south, but not as accessible to those who live south east. (no buses that go that way).	OLIVE	11
36	How will bus services be distributed among the new train station?	OLIVE	11
37	Why is all the trains & buses centered around Halsted?	OLIVE	3
38	Well done, CTA. Continue to work to finalize the approval. In the long run the 130th St stop will be the most cost effective, the most equitable solution, the highest federal priority in the low income communities will have access & more parity.	OLIVE	13
39	One of the concerns CTA expressed previously was the capacity of the existing rail yard at 95th. If the proposed UP route would be shortened, how would the existing rail yard be improved?	OLIVE	5
40	Similar to your presentation on the Heavy Rail findings, improvement to the 95th St station need to considered to your findings for the UP Route and its needs to address overuse at the 95th St station.	OLIVE	3, 11
41	The social and economic benefit factor for the UP Route should be higher, against your heavy rail measurement. Can a review of factors be re-examined prior to June 18th?	OLIVE	7
42	I feel this is a great idea for 130th. And it will contribute to transit riders in the south. And project TSM seems the best of all!	OLIVE	13
43	Originally the Red Line was supposed to continue to Altegeld Gardens. That is what it should do.	OLIVE	13
44	I truly support the far southside Red Line Extension project	OLIVE	13
45	Who was funded this transportation surveys and how much did they cost.	OLIVE	1, 8
46	We are pleased that you have come to the conclusion to recommend the Union Pacific Rail alternatives. This area is the most needed in my opinion and other of my associations. We appreciate your dedication to the project and your hard work.	OLIVE	13
*47(47-49)	What would the station at 130th St (UPRR) be connected to? (Bus-Access to suburbs BRT?	OLIVE	11
48	Would acquiring space for trains cause a delay in final decision?	OLIVE	1,10

August 2009

No.	Comment/Question	Received Via*	Topic Area(s)
49	Would CTA extend it existing bus service to accommodate the rider-ship w/o passing thru Altegeld Gardens?	OLIVE	11
*(50-52)50	Does this extension depend on the stimulus money from the state to complete?	OLIVE	8
51	How much input or cost would be dependent on acquiring the land adjacent to UPRR lines, are they in favor?	OLIVE	10
52	Proposed date for completion of the screening process and final decision to proceed?	OLIVE	1
53	Recently attended a Chicago Plan Commission Mtg and heard presented the possibility of station being attached to a new shopping center at 115th Michigan your pictures place the station about 2 blocks away . Wondering which way your going in this case.	OLIVE	10
54	I support the far southside Red Line Extension Project to 130th Street. With the extension to 130th St. Are there any plans of the communities east of 130th Street? How does our plan stand in relation to the other extensions?	OLIVE	11,13
55	HRT Ext via UPRR to 130th. Have you considered extension to South Shore Station in Hegewisch. You would have transit interface between "L", South Shore, CTA bus, and PACE bus routes. There is Park & Ride already there.	OLIVE	2, 3
*56 (56-59)	What would the parking lost be-Affordable?	OLIVE	6
57	how many homes will be affected by rail line on Union Pacific Rail Route?	OLIVE	10
58	I don’t like the short version of Build Extended Version.	OLIVE	13
59	What connective service will be provided for residents south of 103rd -east of Ford Freeway.	OLIVE	11
*60 (60-61)	Once you reach the environmental impact statement would it be exclusive of environmental justice principles?	OLIVE	10
61	What skills set would be required in eh construction of proposed site for employment purposes? Would area's residents have preference to job opportunities?	OLIVE	10

Red Line Extension Alternative Analysis Study

Screen 3 Public Involvement-Public Comments and Questions

August 2009

No.	Comment/Question	Received Via*	Topic Area(s)
62	While I support the initiative the CTA is taking by trying to improve transit in this area. I believe it should be done in different way. Instead of building a new heavy rail to brt extension. I believe the CTA should implement something similar to the grey line proposal. First of all, I think service levels on the Metra Electric line should be increased to near CTA levels. Unknown to many people, train frequencies on the Metra line used to be every 10 minutes until they were cut back in the 1960's. The benefit of this plan is that increasing trains on the Metra Electric could be implemented almost immediately compared tot he years it will take to build the Red Line Extension. Also, the Metra Electric line is not the typical commuter rail described in your alternatives study. In your study you stated that station spacing is typically 3 to 7 miles apart. However, this is far from the true in the study area where Metra Electric stations are as close as 4 blocks. This station spacing is closer than your proposal for heavy rail. This provides a convenience to riders that would not be attainable with the proposed CTA extension. The other thing about the Metra line is that it is totally electrified. With electric power comes greatly increased acceleration power and lower operating costs due to not having to pay for diesel fuel. To address the bus congestion use at the 95th Street is very easy in my proposal. If half of the buses were rerouted to nearby Metra stations (which many are closer tot he bus routes) the issue would be solved. The reason this was not done before was because service frequencies on Metra Electric were traditionally low and would make trips to time consuming while waiting for a train to come. Furthermore, the Red Line extension will be extremely cost prohibitive and it would be cheaper to implement the grey line plan because all of the infrastructure is already in place. This extra money could then be used to rebuild badly aged Metra Stations which then will attract new riders and economic development. Another important factor is that the Metra Electric line largely parallels the proposed route of the CTA extension. Therefore, ridership will decline because in 1969 when the CTA Dan-Ryan line was built, ridership between 75th and 111th Street Metra stations declined 75%. So what essentially is going to happen is that riders will be siphoned off the Metra line to the new CTA line because service frequencies will be higher. In my opinion this is a big waste of taxpayer money when the CTA is having a hard enough time maintaining what they currently have due to a lack of money.	OLIVE	2
63	What park-and-ride plans are there for the UPR alternative at 130th?	WCPL	6
64	Will environmental engineering be used in PE?	WCPL	1, 12
65	How does the new train yard for the UPRR route factor into cost-effectiveness	WCPL	5
66	The reconstruction in the area of people homes want plan do you have to relocate and have you talked to them, and the feed back.	WCPL	10
67	Job training for the people to work on the new line! Starting wages.	WCPL	10
68	Would homes be uprooted in order to extend the Red Line to 130th?	WCPL	10
69	Approximately how many homes will be removed to make way for the rail proposals?	WCPL	10
70	Is there consideration for transfer stop at 115th/Kensington Metra Line? And/or with transfer stop to 130th and South Shore Line?	WCPL	2
71	Please consider establishing connection points between Metra and Kensington/115th or at points along the proposed SE corridor.	WCPL	2
72	With this project and the "New Starts" funding process is there a chance for a Public/Private funding option, which may bring the project to completion sooner.	WCPL	8
73	Why haven't you considered building the rail line on the I-57 expressway?	WCPL	3
74	Why not use Medium of I-57 it would be less destruction to surrounding neighborhoods.	WCPL	3

No.	Comment/Question	Received Via*	Topic Area(s)
75	Will the Red Line Extension project get any money from the American Recovery and Reinvestment Act? If so how will that stimulus money effect phases and time-line for project?	WCPL	8
76	We do hope that we will move forward with this project. The extension of the Red Line to the far southside is desperately needed. I do hope that construction will be done exponentially.	WCPL	13
77	If CTA acknowledges that 95th/Dan Ryan (Red Line) as it is unsafe why did the Brown Line project and Blue Line projects start first? Is there a plan for survey the community on what they want because80 percent meeting are not representative of what we want.	WCPL	2,9
78	The alternatives to the red line extension seems to cut thru some communities and homes. If this is the case what will happen to the homes and residents between 103rd and 117th? Will these residents be compensated? If so, through what method?	WCPL	10
79	If funding is not available for the red line extension, what alternative plan is in place to relieve congestion at the 95th Street station?	WCPL	3, 8
80	95 W has passed by the time get we get out of work on 95th & Halsted.	WCPL	14
81	I'm in support of the Red Line Extension for future.	WCPL	13
82	Support Red Line train.	WCPL	13
83	The safety of CTA & UPRR passenger was great and all people do not have cars so alternative transportation is great for Chicago and CTA it will work.	WCPL	13
84	We are in favor of the Union Pacific Red Line Extension ending at 130th St.	WCPL	13
*85 (85-86)	How long will it take to complete the Red Line extension project. Also when will it begin?	WCPL	1
86	When will the bus alternative on Halsted Street start?	WCPL	1
87	Do you have a starting date for this project 2009-2010?	WCPL	1
88	How long will it take for construction to start? Will all the stations have park N ride? Where will the Red Line leave it current route to get on the UPRR alignment?	WCPL	1, 3, 6
89	Will the proposed rail extension begin at the 95th street terminal or will it be connected by shuttle bus to the 95th street terminal?	WCPL	3
90	Would the extension eliminate the "back up" that generally occurs from 69th to 87th St. from time-to-time especially during the rush hours? Is this caused by limited space in train yard?	WCPL	11
91	Have equity issues been considered as the plans have evolved such as: greater access for low-income communities, no park 'n' rides on the southside from Chinatown south, limited to no accessibility at stops south of 22nd St., and no extensions to city limits for southside residents.	WCPL	10
92	If the rail ended as 115th St wouldn’t the likelihood of completing the line be having to go back to this long term drawing board? Another 30 years? Wont this shortchange the prospects for future ridership.	WCPL	3
93	What noise abatements have been considered?	WCPL	10
94	Is it possible to shift the proposed alternative from east to west on the UP to circumvent or limit displacement.	WCPL	10, 12

No.	Comment/Question	Received Via*	Topic Area(s)
95	Based on my review of your current plans, I have decided to support the idea of having a station just north of 130th street. This alternative reduces the potential of at-grade traffic conflicts on 130th street. It also allows for a more seamless access to park and ride lots along with the bus turnaround. I would also like to see a kiss and ride facility along with a small bike and ride lot and car share zip car at the station/ I am also in support of adding a bus turnaround at 103rd Street and 111th Street to accommodate route changes for CTA route 100, 103, Potentially route 14, Potentially route 15, potentially route 28, and potentially a Hammond Transit Route at 103rd. A turnaround at 111th Street could accommodate route 352, 359, and a streetside 111. These stations should also have Coffee shops, bike and ride facilities, and heated bus waiting areas	EMAIL	6, 12, 13
96	Concerning the Red Line extension from 95th to 130th Streets. The route selection paralleling the Burlington Northern Railroad's tracks seems to be the best of the alternatives explored. However, there is a safety issue for CTA riders using the station facilities that are location where the CTA's elevated tracks run parallel with the BN's Tracks. The problem is that large volumes of riders will have to routinely cross the BN's tracks when proceeding to and from the stations. With increased train traffic and longer trains, I think it is reasonable to expect that there will be numerous occasions when pedestrian access over the BN's crossing will be blocked for short periods of time. This may happen because of the length of a train, or because of some sort of operational delay. When this happens, even with grade crossing protection in place, some riders, left with no other options, are going to try and beat approaching trains, or climber through or even under standing trains. I suppose the railroad's right-of-way could be fenced off at the stations, but the streets would still be open and the opportunity for pedestrians to exercise the kind of bad judgments described above would still be available. While it would seem improbable that people would be in such a hurry that they would make such dangerous choices, it has happened before, sometimes with disastrous results. With that having been said, it is my opinion that a pedestrian overpass for CTA riders should be constructed as part of each CTA Station located where the CTA's tracks parallel the BN's tracks.	EMAIL	4, 12
97	The 107 Throop area would be a great second stop on the extension line. Buses could feed into the terminal from Vincennes and Halsted and there is a curved street that could be used for bus turn around this stop would also service two High Schools. The 111th - 115th street buses could pull in the Pullman, Roseland travelers. Riders 119th and beyond would use the end of the line 130th ST terminal. If the 107th terminal is built large enough and High speed tracks are installed there would be little need for costly multiple terminals and stops between 95th and 130th.	EMAIL	3
98	Inka Internet Station at 11320 South Halsted in Chicago, supports the Red Line extension project from 95 th Street to 130th street.	EMAIL	13
99	I'm writing to let you know that I support the extension of the CTA Redline from 95th - 134th St. It is vital that the state and CTA start to recognize the importance of the residents who live beyond 95th & state. It is necessary that Red Line be extended to service these residents, which I might state is long overdue! Governor Quinn, please include the CTA Red Line Extension project in the 2009-2010 Illinois State Budget and request full funding now. "I support the extension of the CTA Redline from 95th - 134th St"	EMAIL	13
100	Please extend the Red Line train to 130th Street	EMAIL	13
*101(101-105)	I do not support the Red Line Extension Plan as designated (the UPRR and Halsted Elevated Proposals). I am in support of effective transportation for the south side of Chicago which is beneficial to the surrounding community. I think that the Red Line Extension proposals will be too destructive to the neighborhood.	EMAIL	13

No.	Comment/Question	Received Via*	Topic Area(s)
102	Please address the following questions: What will happen to the structure of the neighborhood with the removal of the homes and businesses along the proposed UPRR/Halsted route? The neighborhood is primarily single home structures. Have studies of other cities' transit transportation and their impact been considered? Thank you for your consideration.	EMAIL	10
103	What is the plan for the 95th street Station? How will the structure be modified to improve its function? How will the station be more accessible to disabled and or elderly riders? Will the footprint of the station increase? Is a parking lot part of the plans for the 95th Street Red Line Station? Where is the proposed site of this lot? Will the homes west and east of the station be raised? Will the public park land be taken?	EMAIL	3, 10
104	Can additional meetings be scheduled to explain the proposals? In talking to people, most were unaware of the four highlighted proposals in the June 4th meeting. People again and again asked if the extension was going to run down i-57. Although the meetings in June were effective in introducing the analysis, many residents in the effective communities are not informed of the proposals.	EMAIL	1,9
105	Why doesn't the expansion branch off to the east (in the middle of the Bishop Ford Expressway) where it would serve the surrounding neighborhoods? Why isn't the proposal heading east in the middle of the Bishop Ford Expressway where it would serve Chicago State University, Olive-Harvey College, and Corlis High School? Please explain in greater detail the use of land that will be needed to develop an elevated train after 95th Street Station? I am concerned that possible expansion (as presented on June 4, 2009) will destroy the homes of hard working people who have mainstay of the neighborhoods. I am concerned that the cement structures as depicted in the presentation will be a physical separation in the flow of the neighborhoods. How will this be addressed?	EMAIL	3, 10, 13
106	I have been a citizen of Chicago, ILLINOIS my entire life. I want Governor Quinn to support and fund the expansion of the CTA train to 134th Street. This community is under serviced when it come to transportation. This expansion proposal has been defeated several times, I believe now is the time for approval when many cannot afford the expense of an automobile. The CTA is our only viable way to safely commute to jobs in this city. Our fellow northern citizen do not have this problem with transportation because the CTA has been expanded thru and outside the city to O'Hare Airport and beyond. The southern based taxpayer are funding transportation to the north, and west sides. We know some monies should be allocated and spent for our general good. So please add the expansion in the budget while there is funding available. I want our Governor to support this expansion and see that it is done to benefit his citizens regards of their location in our great state.	EMAIL	13
107	I support the CTA's Red Line Extension Project (95th to 130th). This service is needed for the Far South Region communities.	EMAIL	13
108	I would like to support Developing Communities Project's call for a red line extension. This effort has been discussed far too long, and it's time to put the funding into the State's 2009-2010 budget for the Red Line Extension Project. It is necessary to think about Chicagoans south of 9th street, not to mention helping the students who attend Gwendolyn Brooks College Prep.	EMAIL	13
109	Please extend the Red Line south beyond 95th Street. As someone who has lived in Chicago, Skokie, Detroit, and St. Louis, I've seen the huge difference that rail transit (or the lack thereof) can make in a neighborhood. Roseland, Pullman, and the other communities south of 95th would benefit greatly from rail service, from the everyday lives of individual people on up to the streetscapes themselves.	USPS	13

No.	Comment/Question	Received Via*	Topic Area(s)
110	I strongly agree with the choice of the UP alignment, but I am troubled by the inclusion of park and ride at all of the stations. If this line is intended to revitalize the areas around the stations at 103rd, 111th, and 115th, parking lots will work against that. Plus- why would we want to increase car traffic around these neighborhood-oriented stations? Better would be to concentrate parking at 130th/Bishop Ford Espy where there would be easy onto access. If access from I-57 is desired, perhaps, a parking deck could be built over the expressway just south of 95th St, with dedicated lanes to/from I-57 and a direct pedestrian connection to the 95th Street Red Line Station.	USPS	6, 10, 13
111-Petition	We the public, supports the CTA's locally preferred route to Extend the Red Line Rail Line from the 95th Street Station to 130th Street, using the Union Pacific Rail Road (UPRR) corridor. In addition, we support the call for a reduction in air pollution, reduced travel time, and increased access to employment and education opportunities in the Far South Region of Cook County, and the State of Illinois, through the construction of the Red Line Extension Project. [Note: 512 signatures included on petition.]	USPS	10, 13

Chicago Transit Authority
Red Line Extension Alternatives Analysis Study

Screen 3 Public Involvement
Responses to Public Comments and Questions

31 August 2009

Written questions and comments regarding the Red Line Extension Alternatives Analysis Study were submitted by a variety of individuals and groups from throughout the Chicago region at the study's Screen 3 Public Meetings held on June 3 and 4, 2009. In addition, public comments and questions on Screen 3 were submitted directly to the Chicago Transit Authority (CTA) via e-mail and postal mail through June 25, 2009.

All of the questions and comments have been collected and compiled to provide a comprehensive review of the issues raised along with CTA's responses. Every question, comment, and suggestion submitted during the public comment period has been compiled in the "Outreach Comment Database" (see separate document). Each question has been recorded verbatim and assigned a number that corresponds with the answers provided in this document, ensuring every question or comment submitted has been reviewed and answered or acknowledged. Collectively, the public comments and preferences will be considered in the evaluation of alternatives and concepts introduced through the public involvement process may be evaluated and/or reflected in subsequent project phases as appropriate.

Many of the comments received were very similar in nature. As a result, similar comments and their responses have been grouped by topic and "General Comment" heading below to avoid duplicative responses. Questions or comments requiring individual or specific responses are also included below along with unique responses. In order to understand some terms used in the Comments and Responses, it may be necessary to review the original Screen 3 presentation materials which are posted on CTA's Web site www.transitchicago.com (News and Initiatives, Alternatives Analysis Studies).

The list below shows the index of topics covered in the report, along with the number of comments received for each. Because comments often refer to more than one topic, the numbers associated with each do not equal the total number of comments received.

Index of Topics

1. FTA's Alternatives Analysis Process and Timeline (12)
2. Relationship of Red Line Extension to Other Proposed Transit Projects (10)
3. Alternatives Analyzed (17)
4. Access to Proposed Red Line Extension Stations (4)
5. Proposed Red Line Extension Operations and Yard (3)
6. Proposed Red Line Extension Parking Facilities (7)
7. Evaluation Criteria Used in the Alternatives Analysis Study (1)
8. Funding for Red Line Extension Construction and Operations (9)
9. Alternatives Analysis Public Involvement Process and Format (6)
10. Potential Red Line Extension Economic and Environmental Impacts (27)
11. Potential Red Line Extension Impacts on Existing CTA and Pace Services (9)
12. Issues to Be Addressed in Preliminary Engineering (6)
13. Statements of Support or Opposition of the Extension (25)
14. Other (1)

1. FTA's Alternatives Analysis Process and Timeline

General Comment:

What is the timing of the Environmental Impact Study, Preliminary Engineering, Final Design, Construction and Operation of the Red Line Extension?

Pertains to Specific Comments:

45, 52, 64, 85, 86, 87, 88

Response to Overall Comment Category:

The FTA New Start grant program requires conceptual transit project proposals to proceed through a formal process of planning, design, and construction. Upon completion of this process, the project is ready for operation. The process involves five formal steps: Alternatives Analysis (AA); Environmental Impact Statement (EIS); Preliminary Engineering (PE); Final Design (FD); and Construction. Each of these steps typically takes 2-3 years to complete although the EIS and PE can be done concurrently. Initiation of each step is also contingent upon federal approval and continued availability of federal and local funding, the timing of which will also affect the overall project schedule. For highly complex projects the Final Design and Construction steps take longer, particularly if construction is implemented in sequential phases rather than all at once.

The current Red Line Extension Alternatives Analysis study is being completed in summer 2009, with the adoption of a locally preferred alternative by the Chicago Transit Board. The subsequent project phase, Environmental Impact Study, is projected to begin in fall 2009. A specific completion year depends on factors outside CTA's control, but is expected no earlier than 2016.

Other Specific Comments Noted on this Topic:

Comments:

30. Will there be public involvement in the Environmental Impact Study? If so, how will that public involvement be conducted?
104. Can additional meetings be scheduled to explain the proposals? In talking to people, most were unaware of the four highlighted proposals in the June 4th meeting. People again and again asked if the extension was going to run down i-57. Although the meetings in June were effective in introducing the analysis, many residents in the effective communities are not informed of the proposals.

Response:

Yes, the Environmental Impact Statement (EIS) will have several opportunities for public involvement.

The purpose of the EIS is to provide full and open evaluation of environmental issues and alternatives, and to inform decision-makers and the public of reasonable alternatives that could avoid or minimize adverse impacts and enhance the quality of the environment.

The EIS process begins with Federal Transit Administration's (FTA) publication of a *Notice of Intent* to prepare an EIS in the *Federal Register* along with similar CTA announcements in local newspapers and other media. At this time, a tentative list of alternatives and impacts is established and presented to the public and interested government agencies for comment. This notification is part of *scoping* - the process of affording an early opportunity for the public and agencies to identify potential issues to be addressed in the EIS. Scoping includes the provision of materials describing the project, alternatives, impacts, and any other relevant information known about the proposed undertaking. These materials are distributed to invite early comments, which will be accepted at scoping meetings – anticipated to be held in fall 2009 – and through written comments.

Following scoping, the EIS is prepared in two stages – draft and final. The Draft Environmental Impact Statement (DEIS) provides an opportunity for government agencies and the public to review a proposed project and alternatives. The principle components of a DEIS include discussion of the following 1) the purpose of and need for action; 2) alternatives, including the proposed action; 3) the affected environment; and 4) environmental consequences. A DEIS must be signed by the FTA Regional Administrator and the authorized official of the local lead or cooperating transit agency. The approved DEIS is then concurrently filed by FTA with the US Environmental Protection Agency (US EPA) and distributed by the local lead agency.

After completion of the circulation period, all substantive written comments and the public hearing testimony are addressed and the preparation of a Final Environmental Impact Statement (FEIS) begins. The principle components of the FEIS include: 1) identification of a preferred alternative; 2) responses to comments made during the circulation period; 3) commitments to mitigate adverse impacts of the project; 4) evidence of compliance with related environmental statutes, Executive Orders and regulations; and 5) a description of changes that have been made to the project since the DEIS was published. Once the appropriate FTA official has approved the FEIS, it is concurrently filed by FTA with the US Environmental Protection Agency (US EPA) for publication of a notification of availability for a 30-day circulation period in the Federal Register and it is distributed and advertised through local media by the local lead agency.

Comments:

32. Will there be a bidding process for the Preliminary Engineering? If so, when will that process begin?
33. Who will compose the Project Management team during the Preliminary Engineering phase? Is there a place for community on the project management team?

Response:

CTA anticipates that the Preliminary Engineering (PE) team will be chosen in 2010. There are two steps that must be completed before the PE team will be selected and PE initiated. After the completion of the Alternatives Analysis study, CTA will submit an Application to Enter Preliminary Engineering to the Federal Transit Administration (FTA) to receive a project rating. First, CTA must receive a favorable rating by FTA to advance to PE. Second, CTA must obtain funding to begin PE. Typically, funding for New Starts projects is obtained at the federal level – more information about funding is provided in Topic Category 8. After these two steps are completed, CTA will procure a consulting team to perform PE services for the Red Line Extension project.

The procurement process will follow standard CTA procurement guidelines, as outlined on the CTA website www.transitchicago.com (click on Doing Business, then Procurement Information). Since PE comprises the technical work to develop and design the engineering specifications for the project, this work is not typically scoped to include community participation. However, this work is often performed in conjunction with the Environmental Impact Statement (EIS), which allows for extensive community participation to understand potential project impacts and evaluate mitigation strategies. Mitigation strategies developed and approved in the EIS phase are incorporated into PE project designs.

Comment:

48. Would acquiring space for trains cause a delay in final decision?

Response:

At this early stage in the process, it is difficult to predict delays associated with land acquisition. Specific issues such as required land acquisition will be studied in the next steps, Preliminary Engineering and the preparation of an Environmental Impact Statement. Required land acquisition typically begins after completion of the Environmental Impact Statement and the issuance of a Record of Decision.

2. Relationship of Red Line Extension to Other Proposed Transit Projects

General Comment:

Wouldn’t this area be better served by the Metra Electric Gray Line service? Can this extension connect to existing Metra Electric or South Shore services?

Pertains to Specific Comments:

18, 19, 27, 55, 62, 70, 71

Response to Overall Comment Category:

Various proposals – the Gray Line or the Gold Line -- call for operational changes to increase service frequency on the Metra Electric District Line and improve CTA connections to this facility as well as fare integration between regional transit services. This would terminate at a station in downtown Chicago. It would not have the same connectivity to the CTA rail rapid transit system that provides accessibility to the entire Chicago area that an extension of the CTA Red Line would provide.

Improved Metra Electric Service meets some of the needs of the study area, such as reducing the lengthy transit commute times experienced by many residents of the study area. However, it will not be included as a build alternative in the current Alternatives Analysis because it does not comprehensively address all of the needs of the project, including alleviating the bus and passenger congestion at 95th Street Red Line station or reducing travel times of passengers that transfer from bus to CTA rail to access their destination. Additionally, as noted in the Screen 1 analysis (available at www.transitchicago.com – click on News and Initiatives, then Alternatives Analysis Studies) commuter rail has several characteristics that are less favorable for the study area than other modes analyzed (such as bus and heavy rail).

There is potential for connection of the proposed Red Line extension to the Northern Indiana Commuter Transportation District (NICTD) South Shore Commuter Rail Line in the vicinity of 130th Street, where the two lines would be adjacent to each other. This potential connection will be explored in further detail during Preliminary Engineering. A connection between the Red Line Extension and Metra Electric District at Kensington/115th Street station is not possible, as the proposed Red Line Extension routing crosses the Metra Electric District Line approximately one-half mile to the south of the Kensington/ 115th Street station.

Other Specific Comments on this Topic:

Comments:

20. Since the money for this project will be included in the general transportation project, what priority will the Red Line extension be given? Is it mainly a matter of getting on the books while other projects are completed?
23. I understand that the CTA as an organization does not consider any of the proposed rail projects. If limited funds are available, what factors will influence where the funds are directed?

Response:

Every five to six years, the United States Congress enacts legislation that authorizes federal funding for highway, transit, motor carrier, safety, and research programs across the country. This federal support represents the primary source of capital funding for CTA and other transit agencies throughout the U.S. The current legislation, known as SAFETEA-LU (Safe, Accountable, Flexible, Efficient Transportation Equity Act - A Legacy for Users), authorizes the federal transit and highway programs through 2009. President Bush signed the act into law on August 10, 2005.

The SAFETEA-LU legislation authorized CTA to seek federal New Starts grant support for four new rail lines or line extensions including: the Red Line Extension to 130th Street; the Orange Line Extension to Ford City; the Yellow Line Extension to Old Orchard; and the Circle Line. In order to qualify for New Starts funding, CTA is required to perform comprehensive Alternatives Analysis studies for each. Alternatives Analysis studies for all four projects are currently underway following the same federally mandated process as the Red Line Extension study, but addressing the unique transportation needs of their respective study areas.

A key objective of the Federal Transit Administration's Alternatives Analysis process is to measure all transit projects from across the nation by the same set of standards. This process ranks projects based on this measurement and not on where they are located. In this way, the benefits and costs of a project can be objectively measured in comparison to all others. Acknowledging that each project has a unique Purpose and Need, the process allows multiple projects from the same region to be rated highly. It is not unusual for a large region such as Chicago to seek approval for several major transit initiatives at the same time. In the late 1990s, CTA won New Starts funding approval for both the Cermak (Douglas)

Branch reconstruction and the Brown Line capacity expansion project at the same time. Metra has also received New Starts funding for multiple projects at the same time. New York City in 2005 had two multi-billion dollar transit projects approved for New Starts funding.

CTA is preparing all of the New Starts projects to be advanced simultaneously from Alternatives Analysis with the selection of Locally Preferred Alternatives in each study area by fall 2009 and has not expressed a priority for any project as they are all intended to address important transportation objectives in their respective study areas.

Comment:

77. If CTA acknowledges that 95th/Dan Ryan (Red Line) as it is unsafe why did the Brown Line project and Blue Line projects start first?

Response:

CTA uses a variety of factors to prioritize among many worthy projects for which there are limited resources. The Red Line Alternatives Analysis Study has identified deficiencies at the 95th Street bus terminal including narrow sidewalks connecting to surrounding neighborhoods, inadequate space within the terminal for passenger circulation and bus maneuvering and frequent presence of pedestrians in the bus drive lanes. These conditions are not desirable because they make transit less attractive and make the terminal less safe. The proposed LPA is intended to address this bus and passenger congestion (among other goals) and prevent conditions from deteriorating in the future.

The Cermak (Douglas) Blue Line Branch reconstruction project, which is now served by Pink Line trains, was prioritized for reconstruction because of the substantially deteriorated condition of track, structure and station facilities that had reached the end of their useful life. Prior to reconstruction, trains speeds were slowed to no more than 15 miles per hour over most of the branch to minimize the risk of further damage to the structure or derailment significantly lengthening commute times and depressing ridership. Conditions were so deteriorated CTA considered suspending service, but funds were secured through the New Starts program for reconstruction.

The Brown Line Capacity Expansion project was motivated by the significant ridership growth on the Brown Line over the last decade. In response to increasing rush hour crowding, train frequencies were increased to the maximum possible. As ridership continued to grow, crowding on rush hour trains exceeded CTA loading standards and the capacity expansion project was planned to lengthen platforms to accommodate 8-car trains (from 6 cars). The $530 million project, now nearing completion, also modernized stations and made them accessible for people with disabilities.

3. Alternatives Analyzed

General Comment:

Explain the alternatives that were analyzed.

Pertains to Specific Comments:

8, 11, 26, 34, 40, 55, 79, 88, 89, 103, 105

Response to Overall Comment Category:

CTA evaluated five alternatives in the Red Line Extension Alternatives Analysis Screen 3, including the No-Build Alternative, two Transportation System Management (TSM) / Bus Rapid Transit (BRT) Alternatives on Halsted Street and Michigan Avenue, respectively, and two heavy rail (HRT) alternatives terminating on Halsted Street and adjacent to the Union Pacific Railroad (UPRR) right-of-way, respectively.

The No-Build Alternative considers the system if no changes are made to transit services in the study area between today and the forecasted year of evaluation, 2030. Existing transit service in the study area includes 22 CTA bus routes and seven Pace bus routes operating on the edge or within the study area, offering extensive north-south and east-west travel options throughout the study area, and primarily terminating at the 95th Street station. The 95th Street station includes a bus terminal facility with 20 bus bays.

Next, CTA evaluated two bus alternatives from Screen 2, combining a TSM – a low-cost option – and BRT for evaluation in Screen 3. The first TSM/BRT Alternative is an enhanced bus route from the 95th Street station to Halsted Street and 127th Street/Vermont Avenue, operating in mixed-traffic on Halsted Street. Bus stop locations are proposed at 103rd Street, 111th Street, 119th Street and 127th Street/Vermont Avenue, with park-and-ride facilities at each stop. The second TSM/BRT Alternative is an enhanced bus route from the 95th Street station to 130th Street via East 95th Street, Michigan Avenue, East 127th Street, South Indiana Avenue and East 130th Street. Bus stop locations are proposed at 103rd Street, 111th Street, 115th Street and 130th Street, with park-and-ride facilities at each stop. These alternatives do not propose to use exclusive lanes; however, implementation of transit signal priority at signalized intersections – to increase bus speeds by extending the green light cycle at traffic signals when needed – is proposed along the Halsted Street and Michigan Avenue portions of the respective routes. A fleet of enhanced 60-foot hybrid articulated buses are proposed. Finally, with each of the bus alternatives, expansion of the 95th Street terminal – extending the existing bus bays along State and Lafayette Streets approximately 250-feet north to 94th Street – to improve circulation and safety is also included.

In addition to the two bus alternatives, two rail alternatives were also evaluated in Screen 3. The first alternative is the Halsted Street HRT elevated alternative. This alternative would depart the current CTA 95th Street terminal station and follow the I-57 Expressway median, transitioning to an elevated structure at Halsted Avenue and traveling south on Halsted Street to 127th Street/Vermont Avenue. This alternative is 5.0 miles long and has four proposed stations– at 103rd Street, 111th Street, 119th Street, and 127th Street/Vermont Avenue – consistent with modern rapid transit station spacing. The second HRT alternative is the UPRR HRT elevated alternative. This alternative would follow the I-57 Expressway as it traveled south from the 95th Street terminal station until the UPRR corridor (adjacent to Eggleston Avenue), where it would turn south to follow the corridor to approximately 111th Street, and then southeast until it crosses over the Metra Electric District tracks at about 119th Street; here, the corridor deviates from the UPRR corridor, continuing southeast at-grade adjacent to the Northern Indiana Commuter Transportation District (NICTD) South Shore tracks to the proposed terminal location at 130th Street near the I-94 Bishop Ford Freeway. This alternative is 5.3 miles long and has four proposed stations – at 103rd Street, 111th Street, 115th Street, and 130th Street.

For each of the proposed rail extension alternatives, an intermediate alternative was also evaluated. The intermediate alternative for the Halsted Street HRT elevated alternative would terminate at the proposed 119th Street station – for a total distance of 3.8 miles and three new stations. The intermediate alternative for the UPRR HRT elevated alternative would terminate at the proposed 115th Street Station – for a total distance of 3.3 miles and three new stations.

All rail transit alternatives would be powered via an electric third rail, consistent with the existing CTA system and rail cars would be equivalent to those used by the existing fleet. Note that with regard to the UPRR Corridor, CTA and UPRR operate services with incompatible train cars and power systems; therefore, in the proposed UPRR Corridor, CTA would have its own dedicated tracks. The elevated alternative would operate adjacent to existing UPRR freight right-of-way (currently at-grade). All alternatives currently have bus terminal facilities and Park and Ride lots proposed in proximity to each station.

Other recommendations and preferences for potential alternatives, alternative design elements, and alternatives extending beyond the study area were provided on the question/comments cards submitted by the public. Staff will review all suggestions and incorporate in the analysis those that merit further consideration.

Other Specific Comments on this Topic:

Comment:

25. Can the land east of the UP south of 119th be used to shorten the line & bring it to grade sooner?

Response:

Yes, concept plans for the Red Line Extension show that traveling southbound after crossing over the Metra Electric District tracks, the Red Line Extension would be at-grade (street level) adjacent to the NICTD South Shore tracks.

Comment:

37. Why are all the trains & buses centered around Halsted?

Response:

Within the study area, the majority of north-south existing bus service is located on Halsted Street and Michigan Avenue. These streets have multiple CTA and Pace bus routes operating on them. During Screen 3 of the Alternatives Analysis study, the two Red Line rail extension alternatives that were studied included Halsted Street and the Union Pacific Railroad corridor, which is located to the east of Halsted Street.

Comments:

73: Why haven't you considered building the rail line on the I-57 expressway?
74: Why not use Medium of I-57 it would be less destruction to surrounding neighborhoods.
97: The 107 Throop area would be a great second stop on the extension line…

Response:

During Screen 1, the I-57 Expressway corridor was analyzed. The I-57 Expressway was one of nine corridors that were examined as part of the Universe of Alternatives. The I-57 Expressway corridor was not recommended for further study in Screen 1 because it was located at the far western edge of the study area and did not address all of the needs of the project, including directly serving population and employment in the study area. Additionally, transit access is more difficult to this corridor due to its location in the median of the expressway. For more information about Screen 1, see the project website at www.transitchicago.com.

Comment:

92. If the rail ended as 115th St wouldn't the likelihood of completing the line be having to go back to this long term drawing board? Another 30 years? Won't this shortchange the prospects for future ridership.

Response:

CTA examined the possibility of ending the Red Line Extension at 115th Street to see if it would better position the project to compete for Federal Transit Administration New Starts funding by improving its cost-effectiveness and also lowering the overall cost of the project. The Red Line Extension is unlikely to be built without the federal New Starts funding. CTA will continue its discussions with the Federal Transit Administration as it continues through the New Starts process (Environmental Impact Statement, Preliminary Engineering, and Final Design) to determine the terminal location of the Red Line Extension. In addition, the current federal surface transportation bill expires this fall, and the re-authorization has the potential to contain revisions to the New Starts process, including changes as to how projects are rated and funding commitments to the program. These potential changes could impact decisions as to whether to terminate the Red Line at 115th Street or 130th Street.

If the Red Line Extension were to terminate at 115th Street, it is unknown as to when the line could be extended to 130th Street. Funding availability will likely be a key factor in the timing. It is anticipated that opening and operating a Red Line Extension to 115th Street will result in increased ridership in the corridor, thus strengthening an already strong travel market.

4. Access to Proposed Red Line Extension Stations

General Comment:

How will Union Pacific trains affect access to the red line station? Have you considered pedestrian bridges?

Pertains to Specific Comments:

6, 24, 34, 96

Response to Overall Comment Category:

For the Union Pacific Railroad heavy rail transit elevated alternative, Union Pacific freight railroad trains may affect access to the Red Line Extension at the proposed 103rd Street and 111th Street stations. At these two stations areas, the Union Pacific Railroad right-of-way has approximately 25-30 trains per day using the at-grade corridor, interrupting street traffic and access to potential Red Line Extension stations. Station design options that facilitate or improve access, such as the inclusion of pedestrian bridges at these proposed station locations, will be analyzed in the subsequent Preliminary Engineering project phase (see Topic Category 12 for more information).

At the proposed Red Line Extension 115th Street/Michigan Avenue station, the Union Pacific Railroad is grade separated, so that access to the Red Line Extension station can be maintained by using Michigan Avenue, which passes underneath the Union Pacific Railroad.

5. Proposed Red Line Extension Operations and Yard

General Comment:

Is a rail yard included in the alternatives, even the shortened alternatives? How does a new yard site factor into the evaluation of alternatives, including cost-effectiveness?

Pertains to Specific Comments:

39, 65

Response to Overall Comment Category:

Yard capacity is an important concern when planning for rail line expansion and additional vehicle requirements. Analysis suggests that current CTA yard capacity is sufficient for CTA needs, including additional cars that would be added with the proposed Red Line Extension.

Three rail yards are accessible from the Red Line and considered in a yard capacity analysis. Howard Yard (at the north end of the current Red Line) has a practical operational capacity of 254 cars, while 98th Street Yard (at the south end of the current Red Line) has a capacity of 234 cars and Linden Yard (at the north end of the Purple Line) has a capacity of 76 cars, for a combined total of 564 cars. The current Rail Car Assignment (as of Spring 2009) provides for 356 cars to be assigned to the Red Line, 88 cars assigned to the Purple Line and 6 cars assigned to Yellow Line service. The total car assignment for the three lines is 450 cars. Because the Red Line operates 24 hour service, 48 Red Line “road cars” will be in service at all times, resulting in a normal maximum total of 402 cars that might be stored in the three yards at any given time. This would indicate that the existing total yard capacity of 564 cars is sufficient to cover the current maximum storage requirement.

Several other factors are also considered when evaluating total yard capacity. Cars may not be evenly distributed between yards, based on the cars that must be available from each yard to meet the daily service requirements or peak period requirements for each line, plus car requirements for maintenance and spares. For the yards/shops to function effectively, the yards should not be filled to capacity. For this study, it is assumed that for efficient operation, yards should not exceed more than 90 percent of their maximum capacity. These factors, combined with the assumption of an additional 78 cars for the Red Line Extension (and additional two cars for the Yellow Line Extension), indicates that the combined Red, Yellow, and Purple Line yard capacity must be at least 482 cars, which is still less than the current maximum combined 564 car capacity of the Howard, 95th and Linden Yards.

Since yard capacity is not a constraining factor for advancing the Red Line Extension, a new yard is not included in the project plans or cost assumptions for the Red Line Extension. Therefore, additional yard costs do not weigh into cost-effectiveness analyses. However, a potential yard site has been identified and may be pursued using non New Starts funding.

One additional factor to consider when evaluating yard capacity is associated maintenance shop capacity and condition. The 98th Street Shop facility is currently 40 years old and at the end of its useful life. CTA has identified replacement of this facility as a state-of-good repair need. While the existing shop can be replaced at its current site, one of the advantages of extending the rail line is that it does allow CTA to consider other sites, which may have additional benefits, for a replacement location. Options to shorten the proposed heavy rail alternatives limit available options for a new yard site; however, if shortened options are considered and alternate shop and yard sites are pursued, non-revenue track (at a cost of up to about $100 million) could be added to the shop replacement cost to extend the line to proposed maintenance locations.

Other Specific Comments Noted on this Topic:

Comment:

28. What is the travel time 130th to Madison?

Response:

Travel time on the proposed Union Pacific Railroad heavy rail transit elevated alternative from the 130th Street station to the Monroe Street station is estimated to be 40 minutes.

6. Proposed Red Line Extension Parking Facilities

General Comment:

Describe the park and ride facilities including locations, fees, and number of parking spaces proposed.

Pertains to Specific Comments:

4, 56, 63, 88, 95

Response to Overall Comment Category:

At this stage in the Red Line Extension project development, general assumptions about park-and-ride facilities were made so that estimate costs for these facilities could be included in total capital and operating cost estimates. However, details for proposed park-and-ride facilities have not yet been finalized. The subsequent project phases, Preliminary Engineering and Environmental Impact Statement, will evaluate land availability and impacts of proposed station locations and adjacent facilities and will provide design requirements for park-and-ride at each station. For the Screen 3 analysis, 1500 total park-and-ride spaces were assumed to be distributed among each of the four stations (or three stations for the shortened alternatives) for each heavy rail transit alternative. The greatest park-and-ride demand (and availability) is assumed at the proposed terminal station for each alternative.

The Chicago Transit Board is responsible for setting the parking rates. Current parking rates for CTA park-and-ride facilities are between $4 and $5 (except for longer-term parking at Rosemont and Cumberland).

Other Specific Comments Noted on this Topic:

Comment:

26. Why not use MWRDGC vacant land at 130th for park & ride?

Response:

Subject to ongoing discussions with the Metropolitan Water Reclamation District of Greater Chicago (MWRDGC), CTA is considering property in the vicinity of 130th Street for a station and park-and-ride facilities. The potential use of this land will be evaluated in the next steps, Preliminary Engineering and the preparation of an Environmental Impact Statement.

Comment:

110. I strongly agree with the choice of the UP alignment, but I am troubled by the inclusion of park and ride at all of the stations. If this line is intended to revitalize the areas around the stations at 103rd, 111th, and 115th, parking lots will work against that. Plus- why would we want to increase car traffic around these neighborhood-oriented stations? Better would be to concentrate parking at 130th/Bishop Ford Espy where there would be easy onto access. If access from I-57 is desired, perhaps, a parking deck could be

built over the expressway just south of 95th St, with dedicated lanes to/from I-57 and a direct pedestrian connection to the 95th Street Red Line Station.

Response:

There are no existing CTA park-and-ride facilities on the Dan Ryan branch of the Red Line. The Red Line Extension provides an opportunity to serve auto access to the Red Line. Although the Red Line Extension park-and-ride facilities have not been sized yet, it is anticipated that the majority of the parking will be provided at the 130th Street terminal station. In the subsequent project phases, the preparation of an Environmental Impact Statement and Preliminary Engineering, the Red Line Extension station park-and-ride facilities will be located and sized, and traffic impacts of these park-and-ride facilities will be evaluated. The construction of a park-and-ride facility over the Dan Ryan Expressway on the south side of 95th Street was not considered for the Red Line Extension project due to high capital costs and community concerns.

7. Evaluation Criteria Used in the Alternatives Analysis Study

General Comment:

41. The social and economic benefit factor for the UP Route should be higher, against your heavy rail measurement. Can a review of factors be re-examined prior to June 18th?

Response:

The Screen 3 analysis of social factors reveals some differentiation between the Halsted and UPRR alternatives. The UPRR alternative is higher than the Halsted alternative in percentage of population under 18, poverty-status and zero-car households. Beyond these factors, all the alternatives are similar as previously analyzed in Screen 2, with approximately the same total population and employment (both now and in 2030), and approximately the same percentages of minority population (all being much higher than Cook County as a whole), population age 64 and over, and population with a mental, physical, or sensory disability. No alternative significantly stands out to be better or worse than any other alternative with regards to social factors, and each adequately serves poverty, minority, youth, senior, and disabled populations as well as zero-car households and poverty-status populations (as designated by the 2000 US Census). Because of this lack of differentiation, all alternatives receive a neutral comparative social factor rating.

8. Funding of Red Line Extension Construction and Operations

General Comment:

How will the construction and operation of the Red Line Extension be funded? Is CTA seeking matching funds?

Pertains to Specific Comments:

14, 16, 20, 22, 72

Response to Overall Comment Category:

Two types of funding are needed for the extension – operating funds and capital funds.

CTA's operating budget supports day-to-day service delivery on its bus and rail system and determines the frequency and hours of service offered. Approximately half of CTA's operating budget comes from customer fares and revenue generated from advertising, concessions and other sources. The other half comes from regional sales taxes, real estate transfer taxes, and matching funds from the State of Illinois. Once the Red Line Extension is built and operational, funds to operate the system are anticipated to be consistent with funding mechanisms that support CTA's other bus and rail transit services.

Meanwhile, CTA has initiated this Alternatives Analysis study for the Red Line Extension as a first step towards obtaining capital funding for the project through the Federal Transit Administration's "New Starts" grant program.[1] This program provides funding for major public transit infrastructure projects throughout the U.S. through a highly competitive process. These are discretionary funds that are only available for system expansions and do not compete with federal funds that CTA receives for capital maintenance (or state of good repair) needs.

Upon successfully advancing through Alternatives Analysis, Environmental Impact Statement, and Preliminary Engineering, a project may receive a Full Funding Grant Agreement (FFGA) from the federal goverment. The FFGA can provide federal funds for up to 80 percent of a project's capital cost including Final Design, although typically project sponsors request 50 percent or less to increase the competitiveness of their projects. Other non-federal funds (in Illinois, these have traditionally been state funds) will comprise the remainder of capital funding. It is possible to seek alternative sources of federal and non-federal funding for the project – such as private sector funding, where available through partnerships or other agreements – but the federal New Starts grant program is specifically intended to support transit projects of this nature and is the public funding mechanism generally most capable of doing so.

CTA is simultaneously pursuing solutions to its overall operating and capital funding challenges while also positioning itself through Alternatives Analysis studies such as this one to secure capital funding to meet the region's future transit infrastructure needs. Many of today's key transit links—including the Blue Line to O'Hare and the Orange Line to Midway—were made possible by past generations who understood the need to invest in transit's future even as they addressed significant day-to-day financial pressures.

At the present time, CTA has limited funding to begin the subsequent Environmental Impact Statement project phase; however, no funding has been identified for completion of the New Starts process.

Other Specific Comments on this Topic:

Comment:

45. Who was funded this transportation surveys and how much did they cost?

Response:

The Red Line Extension Alternatives Analysis Study cost $1.8 million; funding was appropriated for the study by the U.S. Congress through the Federal Transit Administration's 5339 Alternatives Analysis grant program.

Comments:

50: Does this extension depend on the stimulus money from the state to complete?
75: Will the Red Line Extension project get any money from the American Recovery and Reinvestment Act? If so how will that stimulus money effect phases and time-line for project?

Response:

CTA did receive funding from the American Recovery and Reinvestment Act (ARRA); however that funding had very strict requirements. The objective of this funding was to get people working right away, and was only applicable to projects that were "shovel-ready," or had completed final design and were ready for construction. As discussed in Topic Category 1, there are five formal project phases for the Red Line Extension project, including Alternatives Analysis, Environmental Impact Statement, Preliminary Engineering, Final Design, and Construction. Unfortunately, this project still has several planning and design steps before construction, so stimulus funding from the ARRA was not applicable to the Red Line Extension project.

CTA used available ARRA funding to purchase new buses, allowing CTA to replace older buses that are more than 12 years old, which is the life expectancy of a bus. Additionally, CTA was able to put people to work right away replacing ties in the rail system and making other facility improvements. So while the ARRA funding was put to good use, it was not available for this project because it had to be spent in such a short time frame.

---

[1] CTA is also conducting concurrent Alternatives Analysis studies for other candidate New Starts expansion projects that have been authorized by the U.S. Congress—including extending the Orange Line to Ford City, extending the Yellow Line to Old Orchard Road, and constructing the Circle Line.

Comment:

79. If funding is not available for the red line extension, what alternative plan is in place to relieve congestion at the 95th Street station?

Response:

CTA is an aging transit system and has a large state of good repair funding need, including replacement of buses and railcars, system improvements to electric, signal and communication systems, track structure and facility repairs, and other miscellaneous needs. State of good repair needs are traditionally funded through federal formula and state funding sources designated for capital improvements and investments. CTA's state of good repair needs are currently estimated at nearly $7 billion.

If funding is not available for the Red Line Extension, capital improvements at the 95th Street Station would need to be prioritized against other systemwide state of good repair needs and funded through the federal formula and state funding sources designated for this type of investment. As described in the TSM alternative, expansion of the bus facility at 95th Street to accommodate existing demand would cost approximately $72 million.

9. Alternatives Analysis Public Involvement Process and Format

General Comment:

What is the public involvement process? Does the public involvement process for the Red Line Extension Alternatives Analysis study allow individuals to comment on the options?

Pertains to Specific Comments:

13, 21, 29, 31, 77, 104

Response to Overall Category Comment:

Public comments are collected through CTA public outreach for each screen of the Alternatives Analysis Study. CTA participates in individual stakeholder meetings as necessary to discuss options and listen to individual stakeholder concerns. Additionally, CTA hosts community stakeholder meetings with representatives of various community groups throughout the study area. We also have met or offered to meet with city, county, state and federal elected officials in the study area and surrounding communities. Meetings also included faith-based organizations, other community and commerce organizations, and city and state agencies such as the Illinois Department of Transportation, Regional Transportation Authority, Metra, and Pace. If your organization would like to be included in the stakeholder's meetings for future project phases, please contact Darud Akbar, CTA Government and Community Relations at dakbar@transitchicago.com.

Public comments are also solicited at the public involvement meetings. The public involvement process for the Red Line Extension Alternatives Analysis study included two public involvement meetings at the conclusion of Screen 1, Screen 2 and Screen 3/LPA analyses. Note that for each set of Screening meetings, material presented was identical. The Screen 1 meetings were held at Chicago State University and West Pullman Public Library. The Screen 2 meetings were held at the West Pullman Historic Visitors Center and the Woodson Regional Public Library. The Screen 3 meetings were held at Olive-Harvey College and the Woodson Regional Public Library. CTA's goal in emphasizing written questions and comments has been to ensure everyone's thoughts are collected and reviewed. During the outreach meeting, some of these comments are addressed; however, public comments were accepted for three weeks after the outreach meetings. Written comments received at the public meetings and other subsequently submitted comments are being answered individually for the record in this document, which will be made available publicly on the CTA web site, by email to public meeting participants, and in hard copy by written request. All of the comment cards and other written communications (primarily emails and letters from elected officials) will collectively become part of the evaluation process and will be submitted to the Federal Transit Administration as a part of the official documentation for the Alternatives Analysis study.

The comments received during the public outreach process can and do shape the development of project alternatives. For example, CTA considered the strong preference of public comments in favor of the Union Pacific Railroad heavy rail transit alternative as one criteria in the evaluation and recommendation of a Locally Preferred Alternative in the Screen 3 evaluation process. Additionally, as noted in Topic Category 10, there will be additional opportunities for public involvement in subsequent project phases, including the subsequent Environmental Impact Statement phase.

After the first public meeting for each of the three Screening phases, the presentation, technical boards and maps discussing the screening analysis – including the screening process, evaluation criteria, and analysis results and recommendations – were posted on the CTA website at www.transitchicago.com (News and Intiatives, Alternatives Analysis Studies, Red Line Extension). As noted above, responses to each written comment collected during the outreach process are addressed in this document, which is also available publicly on the CTA website, by email or in hard copy.

10. Potential Red Line Extension Economic and Environmental Impacts

General Comment:

What will be the economic and environmental impact of the Red Line Extension? How and when will the analysis be conducted? Does it evaluate equity issues or include an environmental justice analysis?

Pertains to Specific Comments:

1, 2, 3, 5, 7, 9, 10, 30, 48, 51, 53, 57, 60, 61, 66, 67, 68, 69, 78, 91, 93, 94, 102, 103, 105, 110, 111

Response to Overall Category Comment:

An Environmental Impact Statement (EIS) will analyze in detail the social, economic, and environmental consequences and benefits of the proposed Red Line Extension. The environmental review process required by the *National Environmental Policy Act* of 1969 (NEPA) and related laws include environmental impact analyses and the preparation of documentation for public review. Per Federal Transit Administration (FTA) guidance, the environmental evaluation begins upon completion of the Alternatives Analysis study, and it will result in a detailed written statement on the anticipated environmental impacts of the Red Line Extension improvements and the steps that will be taken to address impacts to the community and the natural environment.

Typically, environmental reviews for proposed transit projects address the potential impact areas of air and water quality, noise and vibration, historic and cultural properties, parklands, contaminated lands, displacement of residences and businesses, and community preservation – including environmental justice. During the federal environmental review process, the CTA will work concurrently with state and other local agencies to also comply with state and local environmental laws. The environmental review process includes opportunities for public review and comment.

See specific comment sections below for more details on particular impacts.

Other Specific Comments regarding Noise and Vibration Impacts:

Comments:

3, 93

Response:

Noise and vibration impacts will be measured according to FTA guidance described in the document "Transit Noise and Vibration Impact Assessment" (FTA-VA-90-1003-06). This assessment includes monitoring existing noise levels along the corridor and using computer models to predict the change in noise levels associated with the extension for residents and other sensitive noise receptors along the corridor. Where noise impacts are predicted to exceed certain thresholds, mitigation strategies will be developed. Mitigation strategies could include rail vehicle measures (vehicle skirts, undercar absorption, and resilient or damped wheels), and guideway measures (sound barriers, rail lubrication on sharp curves, and ballasted track).

Other Specific Comments regarding Property Acquisition:

Comments:

3, 48, 51, 57, 66, 68, 69, 78, 94, 102, 103, 105

Response:

The recommended locally preferred alternative, the Union Pacific Railroad (UPRR) alignment would be located adjacent to the east or west edge of the UPRR right-of-way (ROW). The width of the UPRR ROW ranges from 65 to 135 feet; however, a 50-foot separation distance between the Red Line Extension and the UPRR tracks for safety purposes would require property acquisition from a combination of public, residential, commercial, and Union Pacific properties. Preliminary analysis in Screen 3 determined that both the east and west alignment options for this alternative (discussed in more detail in Topic Category 12) would include between 100-140 property acquisitions or displacements, which will be studied in much greater detail in the subsequent project phase. The Environmental Impact Statement phase will study potential impacts, including community preservation, to both determine the alignment option that minimizes impacts and propose mitigation measures.

Public acquisition of private property is governed by federal and local laws, including the Uniform Relocation Assistance and Real Property Acquisition Policies Act. In accordance with these laws, affected property owners would be compensated for their properties based on fair market values and can be provided relocation costs. Many highway and transit projects require relocations. For example, the CTA's recent Brown Line Expansion Project required some relocations. Furthermore, if relocations or other environmental impacts are found to be too objectionable for alignments adjacent to the Union Pacific Railroad right-of-way, then the Halsted Street alternative for the Red Line Extension could also be examined.

Other Specific Comments regarding Business Impacts and Economic Development:

Comments:

1, 2, 3, 9, 53, 110, 111

Response:

The Red Line Extension is anticipated to support economic development in the study area, especially in the vicinity of the four new stations. The extension will improve access to these areas, including job access for workers and result in greater foot traffic for retail development.

For example, CTA has been coordinating with the City of Chicago Department of Community Development to secure an easement for a potential station at the site of a proposed grocery store and other shopping development near 115th Street and South Michigan Avenue. The recommended locally preferred alternative would provide access to the proposed development and underscores the types of benefits that can be achieved from coordinated transit and city planning. These types of economic development benefits will be further evaluated in the subsequent Environmental Impact Statement project phase.

For business relocation impacts, see comments regarding Property Acquisition (also in Topic Category 10).

Other Specific Comments regarding Jobs:

Comment:

10, 61, 67

Response:

CTA will continue to work with all stakeholder groups to provide information and opportunities for all qualified applicants. All contract procurement will follow CTA's competitive bidding requirements open to all qualified firms. CTA has an established procurement process that works with disadvantaged business enterprises under the Illinois Unified Certification Program. This project will follow the same procurement process as other CTA projects. More information about CTA's competitive bidding requirements is available on the CTA web site at www.transitchicago.com. In addition, CTA is working with the Mayor's

Office of Workforce Development to ensure that training and jobs access will be available to support the construction of the proposed Red Line Extension.

Other Specific Comments regarding Safety and Security:

Comment:

5, 7

Response:

Safety and security are a top priority at the CTA. The CTA works with the City of Chicago and other municipalities served by the CTA to provide plain-clothed and uniformed patrols of system property, in addition to hired private security guards at stations and onboard transit vehicles.

During subsequent detailed design phases, particular attention will be devoted to physical security measures than can be incorporated into the design including CCTV monitoring, lighting, vandal-resistant materials, and clear sightlines.

11. Potential Red Line Extension Impacts on Existing CTA and Pace Services

General Comment:

How will communities beyond the potential extension (south, east or west) be served, depending on which alternative is selected?

Pertains to Specific Comments:

8, 35, 49, 54, 59

Response to Overall Comment Category:

The Red Line Extension heavy rail alternatives will result in shortened feeder bus rides, including to residents in the south and southeastern portion of the study area. East-west feeder buses in the study area and beyond via 103rd, 111th, 115th, 119th, and 127th/130th would provide access to a Red Line Extension heavy rail alternative. In addition, the proposed stations on either Red Line Extension heavy rail alternative would have park-and-ride facilities, which are not available on the existing Red Line Dan Ryan branch.

If the Red Line Extension extends to 115th Street, instead of 130th Street, bus service would be provided from the southern portion of the study area, including Altgeld Gardens, to the new Red Line Extension 115th/Michigan station. These feeder bus trips to the 115th/Michigan station would be over two and one-half miles shorter than going to the 95th Street station.

Specific Comments on this Topic:

Comments:

36. How will bus services be distributed among the new train station?
47. What would the station at 130th St (UPRR) be connected to? (Bus-Access to suburbs BRT?

Response:

Routes that currently go east-west along 103rd, 111th ,115th or 119th Streets would be reconfigured to serve new proposed rail station locations on those streets, instead of traveling north to 95th Street Station. Also buses coming from the south, including Pace buses from the south suburbs, would also connect at intermediate stations instead of traveling to 95th Street Station before connecting with the Red Line. The goal of service reconfigurations to bus routes would be to improve travel times by reducing time spent on buses and at the 95th Street bus terminal and facilitate a faster transfer to rail. In summary, bus routes considered for reconfiguration include CTA Routes 9, 30, 34, 103, 106, 108, 112, and 119, and Pace Routes 352 and 359.

The Red Line Extension 130th Street station would include park-and-ride facilities for automobile access. It is anticipated that CTA bus Routes 30 South Chicago and 34 South Michigan, and Pace bus route 348 Riverdale Connector will serve a proposed Red Line Extension 130th Street station.

In addition, CTA and Pace regularly review existing bus service for improvements and will continue to do so while the Red Line Extension project progresses through the federal New Starts grant process, which includes several phases (see Topic Category 1 for more information about the New Starts process). Opportunities to make changes to bus service between now and the completion of the Red Line Extension will include public input before any changes are implemented permanently.

Comment:

40. Similar to your presentation on the Heavy Rail findings, improvement to the 95th St station need to considered to your findings for the UP Route and its needs to address overuse at the 95th St station.

Response:

The Red Line Extension will relieve congestion at the 95th Street Station by shortening and re-routing several CTA and Pace bus routes that currently serve the 95th Street Station to serve the proposed Red Line Extension intermediate and new terminal stations. Buses that currently serve the 95th Street Station that are proposed to be shortened to terminals at new Red Line Extension stations include CTA Routes 103 – West 103rd Street, 106 – East 103rd Street, 111 – Pullman/111th/115th, 119 – Michigan/119th, and Pace bus routes 348 – Riverdale Connector, 352 – Halsted, and 359 – Robbins/S. Kedzie. These bus re-routings will result in the reduction of current 95th Street station bus terminal congestion, both in terms of the number of bus vehicles serving the station, a reduction in passenger-bus conflicts as passengers walk from the their bus drop-off/pick-up locations to the station house, and the total number of passengers on the station platform.

Comment:

90. Would the extension eliminate the "back up" that generally occurs from 69th to 87th St. from time-to-time especially during the rush hours? Is this caused by limited space in train yard?

Response:

Today, Red Line trains approaching 95th Street station are often delayed outside the station because trains are occupying both terminal tracks. This delay is not a result of insufficient capacity in the rail yard, but is an indication of a rail terminal station that has reached or is exceeding capacity. CTA seeks to manage these delays by minimizing the time trains spend laying over at the 95th Street platform and returning to service. Ideally, the 95th Street terminal station would be configured to have three tracks with two island platforms similar to terminals at the Orange Line or O'Hare Blue Line, which offers an additional track to store trains and prepare trains for a return trip. With the expressway on either side of the tracks, limited right-of-way width does not allow for this design. The extension will allow for a modern station configuration to be constructed, which should minimize or eliminate delays approaching the new terminal station.

12. Issues to be Addressed in Preliminary Engineering

General Comment:

Will green technologies or environmental engineering be used? Will pedestrian access to stations adjacent to the UPRR be provided? Will the UPRR extension be on the east or west side of the UPRR right-of-way? What station amenities may be included in station design?

Pertains to Specific Comments:

17, 34, 64, 94, 95, 96

Response to Overall Comment Category:

A number of comments received include suggestions for detailed project design elements. These comments are noted and will be evaluated during Preliminary Engineering.

13. Statements of Support or Opposition of the Extension

General Comment:

Statements of support or opposition to the extension and the locally preferred alternative presented were provided on the question/comment cards submitted by the public. CTA staff will review statements of support or opposition to the extension; other suggestions will be considered for incorporation into the analysis as appropriate.

In Support:

15, 38, 42, 43, 44, 46, 54, 58, 76, 81, 82, 83, 84, 95, 98, 99, 100, 106, 107, 108, 109, 110, 111 (includes 512-signature petition in support of recommended locally preferred alternative)

In Opposition:

101

Support for Other Alternatives:

105

14. Other

General Comment:

This section includes general comments and viewpoints that can be characterized as public input into the study process.

Pertains to Specific Comment:

80

Response to Overall Comment Category:

These comments do not ask a question or refer to a specific issue, but rather point out general views on the subject, which have been noted. Thank you for your feedback.

CTA Customer Service representatives were in attendance at the public meetings for the Red Line Extension and were available to answer specific questions on existing CTA services and to take suggestions for improvements to those services. Any questions submitted to the Red Line Extension study team that covered customer service topics were outside the purview of this study itself. The study team notes these questions and comments for the record and refers them to the CTA Customer Service Department for an independent response and filing through CTA's established Customer Service procedures.

Red Line Extension Project Update

Monday, March 12th 2012

- **Draft Environmental Impact Statement (DEIS)**
    - Continued Federal Transit Administration coordination and approvals during DEIS

    - DEIS Activities and Schedule
        - Conceptual Engineering   Spring 2012 – Summer 2012
            - Conduct field surveys
            - Develop station concepts
            - Finalize drawings for all the alternatives

        - Public Participation Plan   Spring 2012
            - Interviews with DCP and other community members

        - Public Meeting   Fall 2012
            - Update to community on project progress and get feedback. This meeting may include information on environmental analyses, results of any interim community outreach, changes in project alternatives, identification of potential funding sources, or resolution of neighborhood issues

        - Environmental Analysis   Fall 2012 - Winter 2012-2013
            1. Transportation
            2. Land Use and Economic Development
            3. Displacements and Relocation of Existing Uses
            4. Neighborhoods and Community Impacts
            5. Environmental Justice
            6. Historic and Cultural Resources
            7. Visual and Aesthetic Conditions
            8. Noise and Vibration
            9. Safety and Security
            10. Construction Impacts

        11. Hazardous Materials
        12. Parklands and Community Facilities
        13. Air Quality and Climate Change
        14. Water Quality
        15. Wetlands
        16. Floodplains
        17. Vegetation and Wildlife Habitat
        18. Threatened and Endangered Species
        19. Geology and Soils
        20. Energy
        21. Indirect and Cumulative Impacts
        22. Section 4(f)

    - ▪ Public Meeting Spring 2013
        - Update to community on project progress, present environmental analysis, and get feedback. This meeting may include information on environmental analyses, results of any interim community outreach, changes in project alternatives, identification of potential funding sources, or resolution of neighborhood issues.

    - ▪ Draft EIS to FTA Summer 2013
        - FTA reviews Draft EIS and provides comments

    - ▪ Public Hearings Winter 2013-2014
        - Present Draft EIS to the community and get comments

- **Preliminary Engineering and Final EIS**
    - o Subject to FTA approvals and funding availability

MEMORANDUM

Date: November 15, 2012

To: George Coleman, Government Affairs & Community Relations Officer
Chicago Transit Authority

From: Gwendolyn M. Rice, Executive Director
Developing Communities Project

RE: **November 30, 2012 Meeting with CTA Chairman Peterson and CTA President Claypool**

Thank you for arranging for us to meet with Chairman Peterson and President Claypool on

November 30, 2012
10:30 a.m.
Developing Communities Project
212 E. 95th Street
Chicago, Illinois

Below are the items as requested:

I. Proposed Agenda

- Developing Communities Project's (DCP) Community Advocacy Role
- DCP's partnership with the CTA
- DCP's partnership with other planning groups
- Financing the Red Line Extension
- Workforce Development
- Transit-Oriented Development
- Project Management Team
- Environmental Impact Statement
- 95th Street Station Improvement

II. Invited (to be invited) Attendees

Representatives from the Red Line Oversight Committee (ROC) of DCP:

- Gwendolyn M. Rice, DCP Executive Director, 773-928-2500

- Eugene Rogers, Chairman, DCP Workforce Sub-Committee, 773-568-8324
- Lou Turner, DCP Public Policy Consultant, 217-972-2447
- Rev. Mitchell L. Johnson, JD, DCP Consultant, 708-418-5033

Should you have further questions or need additional information, please let me know. I can be reached at 773-928-2500 or gmrice@dcpchicago.org.

Appendix J	Comment Cards
Appendix K	Fact Sheets
Appendix L	Exhibit Boards

1.0 Overview

CTA conducted an open house to update residents about the Red Line Extension project. This update included summarizing the results of the NEPA scoping process that concluded October 27, 2009. The open house also was an opportunity for community members to ask questions about the range of actions, alternatives, environmental effects, and mitigation measures to be analyzed in the Environmental Impact Statement (EIS).

2.0 Open House Database

The notification database, which was developed for the September 2009 scoping meetings, was maintained and updated for this open house. To the extent possible, the database included both mailing addresses and e-mail addresses.

The notification database developed for scoping includes residents and businesses adjacent to the proposed build alternative alignments. Addresses for businesses and residences on parcels either immediately adjacent to the proposed alignment or separated from the alignment by a street, park, vacant parcel, or one residence, were included in the notification database. Parcels on both the east and west sides of the UPRR Alternative and parcels adjacent to both sides of the Halsted Alternative were included. The database also included those who attended meetings or provided comments in the Alternatives Analysis (AA) phase and/or during the September 2009 scoping process.

In addition to those identified during the AA process and September 2009 scoping meetings, the database was expanded to include residents who had requested to receive updates about Your Red projects during the January 2011 scoping meetings for the Red & Purple Modernization project. At the time of the open house, a total of 3,868 parties were listed on the Red Line Extension project database including 3,708 mailing addresses and 751 e-mail addresses.

3.0 Public Notification Activities

Postcard invitations were mailed directly to people in the project database and e-blast messages were sent to individuals on the e-mail distribution list. CTA also posted "transit cards" on CTA vehicles and in transit stations, and placed newspaper display ads in three publications. Additionally, the Red Line Extension project website was updated with information about the open house.

3.1 Postcard

Postcards were mailed on July 15, 2011 to a list of 3,868 entries that included elected officials, government agencies, residents, businesses, community organizations, neighborhood associations, and property owners adjacent to both sides of the proposed build alternative alignments. The postcard provided details about the open house including the closest transit access. The mailing list is included in Appendix A and the postcard is in Appendix B.

3.2 Transit Cards

In order to reach a large audience of transit riders, CTA placed "transit cards" or "car cards" with the open house information in various buses and stations in the project area. CTA distributed approximately 860 transit cards on July 11, 2011 for posting at all Red Line stations, on Red Line rail cars and on bus routes originating from the 103rd Street Garage. A copy of the transit card is in Appendix C.

3.3 E-blast

On July 18, 2011, an invitation e-mail that included information about the open house was sent to 751 e-mail addresses of people who had previously demonstrated an interest in the Red Line Extension project. A copy of the e-blast is in Appendix D.

3.4 Newspaper Display Advertisements

To invite the public to the open house, display advertisements were placed in three newspapers within the project area. Newspapers were selected based on their geographic focus, language needs and audited circulation numbers. Display ads ran during the weeks of July 17 and July 24, 2011. Ads were placed in different papers on different days of the week. The tear sheets of each newspaper ad are in Appendix E.

Newspaper	Ad Size	Geographic Coverage	Language	First Ad Date	Second Ad Date
Chicago Sun-Times	1/4 page	Region	English	Sun, 7/17/11	Mon, 7/25/11
Hoy	1/2 page	Citywide	Spanish	Mon, 7/18/11	Tues, 7/26/11
Chicago Defender	1/4 page	South	English	Wed, 7/20/11	--
Chicago Defender	1/2 page	South	English	Wed, 7/27/11	--

3.5 Project Website

The Red Line Extension project website, www.transitchicago.com/redEIS/, was updated in July 2011 to include details about the open house. The website was originally developed in fall 2009 for the project and contains information about the project alternatives, the National Environmental Policy Act (NEPA) process and the scoping report.

3.6 Additional Outreach for Open House

In order to maximize the coverage of the outreach effort for the open house, CTA sent a news release to local media outlets.

4.0 Elected Official and Stakeholder Briefings

CTA representatives conducted 12 briefings with elected officials or stakeholders about the Red Line Extension project. Most of the briefings were conducted prior to the open house to allow elected officials an opportunity to reach out to their constituents prior to the open house. Generally, briefings covered a description of the project and the scoping process. CTA officials met with:

- Office of Illinois Representative Monique Davis, 27th District, July 20, 2011
- Office of Illinois Senator Emil Jones III, 14th District, July 20, 2011

- Office of Chicago Alderwoman Carrie Austin, 34th Ward, July 21, 2011
- Office of Chicago Alderman Anthony Beale, 9th Ward, July 21, 2011
- Developing Communities Project, July 21, 2011
- Office of Chicago Alderman Roderick Sawyer, 6th Ward, July 25, 2011
- Roseland Business Development Council, July 26, 2011
- Office of Chicago Alderman Howard Brookins, Jr., 21st Ward, July 27, 2011
- Office of Cook County Commissioner Joan Patricia Murphy, 6th District, July 27, 2011
- Office of U.S. Representative Jesse Jackson, Jr., 2nd District, July 28, 2011
- Office of Illinois Senator Martin Sandoval, 12th District, July 29, 2011
- Office of Illinois Representative Cynthia Soto, 4th District, August 8, 2011
- Illinois Representative William Davis, 30th District, August 1st, 2011

Summaries of each elected official briefing are in Appendix F except for the meeting on August 1st at which no notes were kept. However, the content of that briefing was similar to the other briefings.

5.0 Participating Agency Update Letters

CTA provided an update on the project to the participating agencies to inform them of the project status and invite them to the Open House. Participating agencies are federal, state, and local agencies with an interest in the project because of an overlap in their area of jurisdiction or some specialized knowledge of potential project effects. The list of participating agencies is in Appendix G. Appendix H contains sample update letters for both federal and state or local participating agencies.

6.0 Open House

CTA conducted an open house to update the public about the project and the results of the NEPA scoping process and to provide people with an opportunity to ask questions about the project in an informal setting. The location was near the center of the project area and was accessible by public transportation. The location was American Disabilities Act (ADA) compliant.

For the convenience of all attendees, bus routes to and from the open house location were publicized on the postcard, the e-blast, and on the website. In order to provide the greatest opportunity for community participation, the open house was scheduled in the early evening on a weekday.

A total of 96 people signed in at the open house. There were a few additional attendees who did not want to sign in. Copies of the sign in sheets are in Appendix I.

Time: 6 to 8:30 p.m.
Date: Tuesday, August 2, 2011

Location: St. John Missionary Baptist Church
211 E. 115th St.
Chicago, IL 60628

During the open house, project team members and CTA representatives were present at project display boards to answer questions related to the technical aspects of the project. The open house session provided attendees with an opportunity to review the project information, clarify their understanding of the project and environmental process, and give feedback about the alternatives. Spanish and sign language interpreters were made available during the open house.

6.1 Materials

Each open house attendee was offered a comment card and a fact sheet on issues that will be analyzed in the Draft EIS. The comment card allowed attendees to submit written comments during or after the open house. The comment card was designed as a self-mailer so that individuals could easily mail comments to CTA if they needed more time to develop them after the open house. The issues fact sheet outlined the concerns community members expressed during the scoping meetings in 2009 and provided a preliminary summary of how the proposed Red Line Extension might affect environmental elements such as traffic, noise, and aesthetics. A second fact sheet on the real estate acquisition process was available to those with specific questions on that topic. Copies of all of the comment cards returned as of the date of this summary are included in Appendix J and a copy of each fact sheet is in Appendix K.

Project exhibit boards were developed and used during the open house. The boards included:

- Welcome to the Red Line Extension Open House
- Red Line Extension – What's New?
- Project Purpose
- Why Extend the Red Line?
- Project Development Process
- Planning for the Red Line Extension
- Environmental Review Process
- Issues Potentially Evaluated in Environmental Impact Statement
- EIS Scoping Comments Received
- Locally Preferred Alternative Union Pacific Railroad (UPRR) Alternative
- Locally Preferred Alternative Union Pacific Railroad (UPRR) Alternative West and East Side Options
- Other Alternatives to be Evaluated in Draft EIS
- Stay Involved
- This is Your Red

Copies of the exhibit boards are in Appendix L.

6.2 Comments Received

Although this open house was not a formal comment period under the NEPA process, people were provided opportunities to comment in writing during the open house or they could submit their comments after the open house via e-mail, fax, or postal letter. Comment cards distributed at the open house were designed to facilitate return of written comments both at the open house and via postal mail later. E-mail comments could be sent to a project specific e-mail address found on the project website. Approximately 13 people provided written comments at the open house and seven people provided comments via email. Comment cards received as of the date of this open house summary are included in Appendix J.

CTA and CWC Transit Group representatives received a variety of oral and written comments from participants during the open house. Overall there was no major opposition to the Red Line Extension. Several residents were eager to learn when the extension will become a reality. Here is an overview of comment themes:

- Inter-governmental planning – Residents want this project to remain a top priority and want to see more inter-governmental coordination.
- Real estate acquisitions – There was recognition that the project may affect residential parcels. Residents were interested in receiving information about the potential schedule for such acquisitions.
- Park impacts – Residents wanted to know if other parks will be added to the community if parks near the extension would be affected.
- Timeline – Community members wanted to know when construction would start so that they can be prepared for disruptions. They expressed concern that the longer the project takes to come to fruition, the less involved the community will be in providing feedback.
- Halsted Alternative – Members of Developing Communities Project wanted to know why the CTA was still considering this alternative. Other community members wanted to know why the CTA didn't choose the Halsted Alternative as the LPA.
- Hours of operation – Several attendees were concerned that the extended Red Line might not be available for 2nd and 3rd shift workers, and that the hours would not align with the schedules for connecting buses.
- CTA bus reroutes – Several attendees wanted to know where the affected buses would terminate once the Red Line is extended.
- Park & Ride lots – Residents would like to see more parking along the Red Line Extension.
- 130th street terminal – Participants mentioned that people travel beyond 130th Street, and expressed interest in extending the Red Line further south.
- Minority contractors – Residents wanted to make sure that local minority contractors would be considered once construction begins.
- Funding – Community members wanted to know how the CTA will fund the extension and if fares will be raised.
- Duplication of services – Some community members mentioned that Metra, Northern Indiana Commuter Transportation District, and PACE provide adequate service to the area.
- Gray Line – A suggestion was made to use Metra tracks and Highliner trains during non-rush hour periods and offer CTA-style "L" service; the Gray Line

proposal was mentioned as an option because population along the Red Line Extension is low.

- High-speed electric trolley bus – Some participants suggested a high-speed electric trolley bus down Eggleston Avenue.
- Noise and vibration – Many residents were concerned about extra noise and vibration.
- Summer temperatures – Some participants said it was too hot for senior citizens to be out at an open house (temperatures on the day of the open house were in the upper 90s).

YOUR RED

Red Line Extension

cta

You’re Invited to Join the Chicago Transit Authority (CTA) at an Open House on the Red Line Extension

Connecting 95th Street Station to 130th Street

CTA is proposing to extend the Red Line 5.3 miles from the 95th Street Station to the vicinity of 130th Street, subject to the availability of funding. This project is one part of the ***Your Red*** Program to extend and enhance the entire Red Line.

Learn about the Red Line Extension

This open house will continue to keep you informed about the proposed Red Line Extension project.

If you require an interpreter, including sign language services, or other accommodations at this open house, contact Deborah Lopez, Senior Government Relations Officer, at least five days prior to the open house at (312) 681-2709 or dlopez@transitchicago.com.

Tuesday, August 2, 2011
6:00 to 8:30 p.m.

St. John Missionary Baptist Church
211 E. 115th St.
Chicago, IL 60628

This location is accessible to people with disabilities and is served by:
CTA Bus #111, #34, and #119 and
Metra Kensington Station

Ghost bikes haunt city sidewalks

Critic says memorials set up for dead cyclists become eyesores over time

BY KARA SPAK

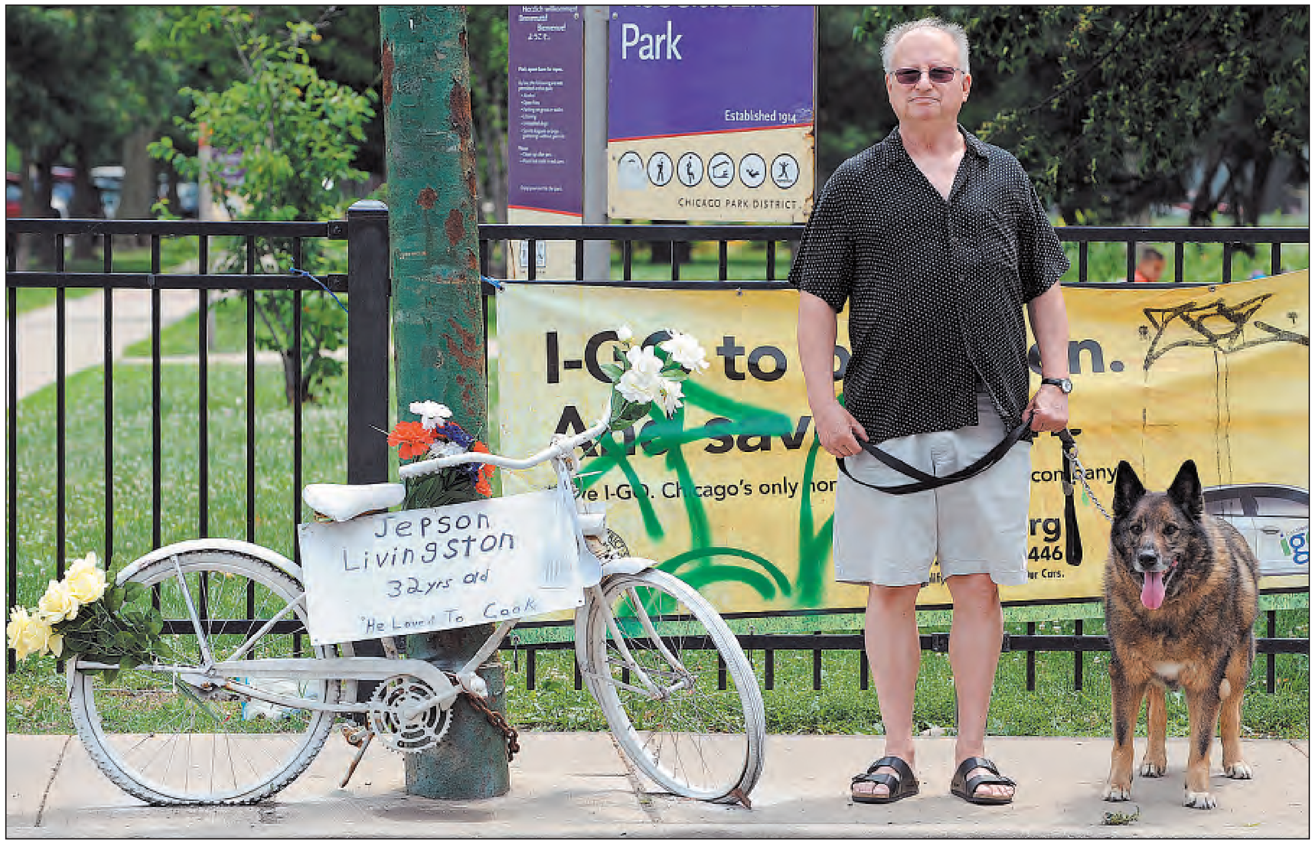
Staff Reporter/kspak@suntimes.com

Almost every day for the last 16 months, Ed Hooks has walked his dog Nugget past a painted white bike at the entrance to the North Side's Kosciuszko Park.

It's a memorial for Jepson Livingston, a 32-year-old man who died in 2009. Livingston was riding his bike on Diversey when he was struck by a van involved in a high-speed chase. The driver was arrested and charged with murder.

Hooks feels for Livingston's family — he also lost a child too young. But he also believes there should be a time limit for memorials on public property, like the so-called "ghost bikes," which he considers an unnecessary eyesore after spending countless months or even years in Chicago weather.

"I grieve for them," he said of Livingston's family. "I grieve with them. That has nothing to do with whether or not a painted white bicycle should be chained to a light post forever in my neighborhood. At a certain point, the family needs to go to the cemetery."



Ed Hooks poses next to the bicycle memorial for a victim of a hit and run crash in 2009. | JOHN J. KIM~SUN-TIMES

But for Livingston's family, the bike remains a source of comfort.

"When I go by the bike, I feel more at peace compared to the cemetery," said Henrietta Livingston, Jepson Livingston's mother.

The urban equivalent of flower-strewn crosses along rural highways, there are about a dozen ghost bikes on sidewalks around Chicago. Painted white and bearing a sign with the name of the dead cyclist, the bikes are meant to serve as a memorial and a warning for drivers and cyclists.

Ghost bikes meet the criteria of Chicago's code for abandoned bikes. Purposefully stripped of parts, they cannot be ridden. They have not been moved in seven days — one ghost bike has been on Western since 2006. City code says abandoned bikes can be ticketed and then disposed of.

But Brian Steele, spokesman for Chicago's Department of Transportation, said the city doesn't move ghost bikes because officials don't consider them abandoned but "important memorials."

"If they do not infringe on the public way, or take up space that would be used by bicycles or pedestrians, [they] can be an important reminder of the impact on loved ones and our society when the rules are not followed by all modes, including the cyclists," Steele said in an e-mail.

For Hooks, a gentle-speaking 65-year-old teacher, author and former actor, the bikes are a legitimate memorial, just like those that appear outside fatal crime scenes featuring candles and stuffed animals. The difference is that the crime memorials are short-lived, he said.

"I would not object to these ghost bikes being there," he said. "I just think they should have an expiration date."

His request for an honest neighborhood discussion about the issue at the website Everyblock led to anonymous cyclists calling him everything from insensitive to a bigot. He said he isn't either, and has learned the hard way what the death of a child is like. His daughter Dagny was 21 when she accidentally overdosed on drugs in 2005 in Lake View.

"There is no closure for the death of a child," he said. "It's a crime against nature. Yet what's the lesson from my daughter's death — don't mess around with drugs. It didn't occur to me to go over [to Lake View] and put a sign up with her pictures and cover it with drug stuff and expect it to be there forever."

Ghost bikes started in 2002 in St. Louis by a bike shop worker. Since then, the bikes have appeared in 22 countries and, in America, 37 states.

In Chicago, the bikes are put up and maintained by concerned cyclists. Some ghost bikes are maintained more carefully than others.

In Boston, the bikes are typically taken down within days by the city, said James McBride of MassBikes, a Boston-based bicycle advocacy organization.

"Some of the shorter-term ghost bikes that stay up, I know people get upset they got moved quickly," he said.

Not all of the Chicago bikes are permanent. One placed near a West Side church was removed by church officials, said Howard Kaplan, who has helped install many ghost bikes. Another near a Walgreen's on the North Side also didn't stay up long, and a ghost bike at the Lincoln, Damen and Irving Park intersection has come and gone several times.

"When I work with the family [of the dead cyclist] to get one put up I tell them there's no guarantee for how long it's going to stay," he said. "If it's up for a year it's a good run."

Kaplan agrees with Hooks that there is no clear way to quantify how effective ghost bikes are as safety warnings. That doesn't mean that they are not valuable, he said.

"I think it's outrageous that you can't ride a bike around the city without risking your life," he said. "I think when a bicyclists is killed it should be noticed."

You're Invited to Join the Chicago Transit Authority (CTA)
at an Open House on the Red Line Extension
Connecting 95th Street Station to 130th Street

Tuesday, August 2, 2011
6:00 to 8:30 p.m.

St. John Missionary Baptist Church
211 E. 115th St.
Chicago, IL 60628
This location is accessible to people with disabilities and is served by:
CTA Bus #111, #34, and #119 and Metra Kensington Station

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the 95th Street Station to the vicinity of 130th Street, subject to the availability of funding. The proposed 5.3-mile extension would include three new intermediate stops near 103rd, 111th, and 115th streets, as well as a new terminal station in the vicinity of 130th Street. Each new stop would include bus and parking facilities. This project is one part of the Your Red Program to extend and enhance the entire Red Line.

Learn about the Red Line Extension
This open house will continue to keep you informed about the proposed Red Line Extension project.

If you require an interpreter, including sign language services, or other accommodations at this open house, contact Deborah Lopez, Senior Government Relations Officer, at least five days prior to the open house at (312) 681-2709 or dlopez@transitchicago.com.

SU LÍNEA ROJA
Extensión de la Línea Roja

Usted queda invitado para acompañar a la
Chicago Transit Authority (CTA)
a una Recepción Pública para la Extensión de la Línea Roja

Para conectar la Estación de la 95th Street a la 130th Street

martes, 2 de agosto de 2011
Desde las 6:00 a las 8:30 p.m.

St. John Missionary Baptist Church
211 E. 115th St.
Chicago, IL 60628

Las personas con incapacidades pueden tener acceso a este lugar, al cual brindan servicio los Autobuses de la CTA #111, #34, y #119 y la Estación Kensington de la Metra.

La Chicago Transit Authority (CTA) se propone extender la Línea Roja desde la Estación de la 95th Street al vecindario de la 130th Street, sujeto a la disponibilidad de financiación. Esta extensión propuesta de 5.3 millas abarcará tres nuevas paradas intermedias cerca de las 103rd, 111th, y 115th Streets, así como una nueva estación terminal en las inmediaciones de la 130th Street. Cada nueva parada incluirá las instalaciones para autobuses y el estacionamiento de vehículos. Este proyecto forma parte del Programa de Su Línea Roja para extender y reformar la Línea Roja por completo.

Infórmese sobre la Extensión de la Línea Roja
Esta recepción pública se dedica a darle noticias actualizadas sobre el proyecto propuesto de Extensión de la Línea Roja.

Si usted necesita intérprete, incluso los servicios de interpretación en el idioma de señas, u otras adaptaciones para esta recepción pública, por favor comuníquese con Deborah López, Oficial Superior de Relaciones Gubernamentales por lo menos cinco días antes de la fecha de la recepción pública al (312) 681-2709 o dlopez@transitchicago.com.

Soldados canadienses se preparan para partir de la base militar de Kandahar. La OTAN empezó a transferir la seguridad del país a las autoridades locales. GETTY

La seguridad cambia de manos

Afganistán empieza a asumir el control del país

Por Fawad Peikar
EFE/KABUL

La misión de la OTAN en Afganistán empezó ayer oficialmente en la provincia central de Bamiyán la transferencia de competencias de seguridad a las autoridades locales, proceso que continuará en cinco zonas más del país durante la próxima semana.

La ceremonia formal de traspaso, celebrada este mediodía, contó con la presencia del máximo responsable de la misión de la OTAN en Afganistán, el general David Petraeus, y de los titulares afganos de Interior, Bismilá Mohamadi, y de Defensa, Abdul Rahim Wardak.

"Las fuerzas de seguridad afganas homenajearon a los militares del contingente internacional por su servicio de los últimos diez años al pueblo de Afganistán y a este país asolado por la guerra", explicó a EFE el portavoz afgano de Interior, Sediq Sediqi.

El acto tuvo lugar en el cuartel de la Policía afgana en la capital de una provincia relativamente libre de actividad insurgente pero que, paradójicamente, es uno de los símbolos del régimen talibán por la voladura de sus famosos Budas gigantes en 2001.

Los cerca de 200 militares de Nueva Zelanda -país representado en la ceremonia por su embajador- y la veintena de soldados de Singapur desplegados en Bamiyán serán los primeros miembros del contingente internacional en cambiar sus funciones.

"Los soldados extranjeros harán a partir de ahora trabajos de entrenamiento militar y de rehabilitación en la zona", dijo el portavoz provincial, Abdul Rahman Ahmadi.

El traspaso de hoy responde al compromiso anunciado el pasado marzo por el presidente afgano, Hamid Karzai, de que las fuerzas afganas asumirían el control de siete áreas durante el mes de julio, en paralelo al inicio de la retirada de tropas de EEUU.

Durante la próxima semana se irán transfiriendo las competencias de otras cinco zonas: la provincia de Panjshir (este) y las ciudades de Mihtarlam (este), Lashkar Gah (sur), Herat (oeste) y Mazar-i Sharif (norte).

Sólo queda por determinar cuándo se hará el traspaso sobre la séptima de esas zonas, la estratégica provincia de Kabul.

"Seguramente se hará al final de esta primera fase de cesión de competencias, pero el Gobierno aún no ha tomado una decisión definitiva sobre la provincia de la capital", dijo el portavoz del Ministerio de Interior.

El inicio de la transferencia en materia de seguridad llega apenas días después de que, el pasado miércoles, empezaran a salir del país los primeros 650 soldados estadounidenses, pertenecientes a dos regimientos estacionados hasta ahora cerca de Kabul.

EEUU prevé retirar este año 10 mil efectivos y 23 mil más hasta de septiembre de 2012, mientras que sus cerca de 70.000 soldados restantes abandonarán Afganistán entre 2013 y 2014.

staurants will make kids menus healthier

Grill, Chevys, Chili's, Corner Bakery Cafe, Cracker Barrel, Denny's, El Pollo Loco, Friendly's, IHOP, Joe's Crab Shack, Outback Steakhouse, Silver Diner, Sizzler, T-Bones Great American Eatery and zpizza.

Joe Taylor of Chilis said the company has responded to consumer demands for healthier foods. While diners looking for a healthier meal used to have to ask for substitutions, they now have more options.

"We've seen our guests customize their meals to a greater degree when they are looking to hold the mayo or add the broccoli," Taylor said.

Patrick Lenow of IHOP said the restaurant will add two new children's menu items because of the effort, including pancakes with fruit and scrambled eggs with fruit. The company had already limited everything on their children's menu to fewer than 600 calories and made fruit a default side, instead of fries -

Bachmann, Pawlenty ramp up war of words

Michele Bachmann

Tim Pawlenty

WASHINGTON — The campaigns of Republican presidential hopefuls Michele Bachmann and Tim Pawlenty resumed their war of words Sunday, arguing via press release over which candidate has the stronger conservative credentials.

Minnesota Rep. Bachmann accused Pawlenty of supporting policies that are anathema to her Tea Party supporters, such as the mandate to buy health insurance and a "cap-and-trade" agreement to reduce greenhouse gases. And she slammed the former Minnesota governor for praising the federal government's 2008 bailouts.

"I have fought against irresponsible spending while Governor Pawlenty was leaving a multi-billion-dollar budget mess in Minnesota," Bachmann added.

Pawlenty's campaign swiftly rejected Bachmann's claims, saying there is "very little difference" between the two candidates' positions.

However, Pawlenty spokesman Alex Conant said, "The difference is that when Governor Pawlenty was scoring conservative victories . . . Congresswoman Bachmann was giving speeches and offering failed amendments, all while struggling mightily to hold onto the most Republican house seat in the state."

Pawlenty in July raised Bachmann's ire when he called her record of accomplishment in Congress "nonexistent."

Bachmann argued again Sunday against that assessment, saying, "I have demonstrated leadership and the courage of my convictions to change Washington, stop wasteful spending, lower taxes, put Americans back to work and turn our economy around."

Appendix F
Elected Official Briefing Summaries

YOUR RED | Red Line Extension

Meeting Notes

Date: July 21, 2011

Present: Alderman Anthony A. Beale, 9th Ward
George Coleman, CTA
Sonali Tandon, CTA
Jeffrey Sriver, Chicago Department of Transportation
Lisa Soard (note taker), CWC Transit Group

Time: 12:30 p.m.

Highlights:

CTA staff presented and left a seven-page packet of Red Line Extension materials. The materials and CTA representatives stressed that:

- Since the 95th Street Station is a highly used terminal and the area south of the Red Line has a need for more transit options, CTA is pursuing this extension.

- Better transit will spur economic revitalization along the current Red Line and the extension.

- Between 2006 and 2009, planners worked with the community to examine several options for placement of the extension. Based on those discussions and studies, the Union Pacific Railroad alternative was chosen as the Locally Preferred Alternative.

- The CTA is in the Environmental Impact Study (EIS) phase of the project as it collects information about how plans would affect the local community and the environment. The August 2nd Open House is part of the EIS phase.

The Chicago Department of Transportation representative added that CDOT would study if there is another way for Union Pacific trains to take a different route to the city, which would free the Union Pacific Railroad right-of-way for the Locally Preferred Alternative.

Overall Alderman Beale was supportive of the plans, and was hopeful that the money can be secured to build the extension.

He had questions and suggestions abut the Red Line Extension.

- **Affect on Parks and Housing**
  Alderman Beale asked if only parks would be reduced or if residential property also would be impacted.
    - CTA responded that they didn't know what would truly be affected as far as housing, but that would be studied in the next part of the EIS.

- **Environmental Impact Statement and Funding**
  He asked when the EIS would be completed and whether CTA had the funding it needed.
    - CTA representatives said to move forward in the process they need to identify state, local and federal funds. They also mentioned that the August 2nd Open House would let the community know that CTA is still focused on the Red Line Extension project and that it is moving forward.

- **Legislative Champions**
  Alderman Beale asked who was spearheading the efforts to obtain funding for the Red Line Extension in Washington D.C. He specifically asked if it was Representative Jesse L. Jackson, Jr. He stated that in his opinion funding for the project was a federal issue and that the project needed a Congressional champion.

YOUR RED Red Line Extension

Meeting Notes

Date: July 21, 2011

Present: Alderman Carrie M. Austin, 34th Ward
George Coleman, CTA
Sonali Tandon, CTA
Jeffrey Sriver, Chicago Department of Transportation
Lisa Soard (note taker), CWC Transit Group

Time: 1:05 p.m.

Highlights:

CTA staff presented and left a seven-page packet of Red Line Extension materials. The materials and CTA representatives stressed that:

- The August 2nd Open House will update the community about where CTA is in the process on the Red Line Extension project.

- The CTA completed the Alternatives Analysis phase and chose the Union Pacific Railroad alternative as its Locally Preferred Alternative based on community input. Scoping meetings were hosted in September 2009 to initiate the Environmental Impact Study (EIS) phase.

- The project is in the EIS phase. In this phase, the effect of plans on the local community and the environment would be studied. However in order to continue, CTA needs funding for the Draft EIS and for construction and operation.

The Chicago Department of Transportation representative added that the Union Pacific Railroad is requesting a 50-foot separation between the tracks. He said that CDOT would study if there is another way for Union Pacific trains to take a different route to the city, which would free the Union Pacific Railroad right-of-way for the Locally Preferred Alternative.

Overall Alderman Austin is supportive of the plans and is thinking about the long term and wants to leave a legacy for the residents of her ward. She also said that she knows her State Representative and Senator support the project.

Alderman Austin had questions and suggestions abut the Red Line Extension.

- **Elected Officials**
  Alderman Austin asked if the CTA had reached out to U.S. Representative Bobby Lee Rush. She also suggested that the CTA contact Andrew J. Mooney, Commissioner of the City of Chicago Department of Housing and Economic Development.
    - CTA responded by saying they would consider reaching out to Representative Rush and Commissioner Mooney.

- **Effect on Parks**
  While looking at the map of the LPA, Alderman Austin asked if any park land would be taken with the extension.
    - CTA representatives said that the purpose of the EIS is to research how parks would be affected and that several parks could be impacted.

- **Metra Modernization**
  Alderman Austin also asked if Metra had any plans to modernize its Kensington Station. She said she was only asking for fresh paint, better lighting, and new signage. Austin wants to make sure that Metra stations are consistent with the potential new Red Line Extension stations.
    - The Chicago Department of Transportation representative answered this question by saying that an elevator was installed at the Kensington Metra station more than 10 years ago and he would convey Austin's request to Metra.

YOUR RED
Red Line Extension

Meeting Notes

Date: July 27, 2011

Present: Alderman Howard B. Brookins, Jr., 21st Ward
Curtis V. Thompson, Jr., chief of staff, Alderman Brookins, Jr.
Sonali Tandon, CTA
George Coleman, CTA
Lisa Soard (note taker), CWC Transit Group

Time: 12:12 p.m.

Highlights:

CTA staff presented and left a seven-page packet about the proposed Red Line Extension (RLE). The materials and CTA representatives stressed that:

- This extension is part of “Your Red,” which also includes Dan Ryan Track Renewal and the North Red and Purple Modernization projects.

- CTA is partnering with the Federal Transit Administration on the extension.

- The extension will help South Side residents save 20 minutes on their commute from 130th Street to downtown and reduce the need for transfers.

- All four proposed stations would have park and ride facilities. The extension would be elevated from 99th Street to 119th Street and after that it would be at-grade.

- Between 2006 and 2009, planners worked with the community to examine several options for alignment of the extension. Based on those discussions and studies, the Union Pacific Railroad (UPRR) alternative was chosen as the Locally Preferred Alternative (LPA).

- The CTA is in the Environmental Impact Study (EIS) phase of the project which will examine at least four alternatives and collect information about how plans would affect local community members and the environment. The August 2nd Open House is part of the EIS phase.

- Funding for the EIS was announced Monday by Senator Richard Durbin. CTA still needs funding for construction and operation of the extension.

Overall Alderman Brookins and his chief of staff, Mr. Thompson, were supportive of the plans and felt that it would have minimal impact on the 21st Ward. Alderman Brookins mentioned that he would have preferred the Halsted alternative and appreciates that it is still being considered during the EIS.

Alderman Brookins and Mr. Thompson had questions and suggestions about the Red Line Extension.

- **Safety**
  Mr. Thompson asked how far the students from Carver Military Academy would have to walk to the proposed 130th Street Station. He said a lot can happen between the school and the station.
    - CTA responded that the distance would likely be ½ mile to one mile from the proposed station to Carver Military Academy.
- **Quiet Zones**
  Mr. Thompson mentioned to CTA that the 21st Ward was pursuing to be a quiet zone and asked whether a CTA train would be quieter than or as noisy as a Union Pacific train.
    - CTA replied that the City of Chicago Department of Transportation (CDOT) is initiating a quiet zone study in the area, and that CDOT also is working with Union Pacific to study if Union Pacific trains could be rerouted.
- **Timeline**
  Alderman Brookins asked when they could expect the RLE to be complete and operating.
    - CTA mentioned that it typically takes two to three years to finish the EIS, and if everything is in place (funding and federal approval) it could be seven to eight years from now, at the earliest, that the RLE could begin operating.
- **Effect on Housing**
  Alderman Brookins wanted to know whether homes would be demolished when the extension becomes a reality.
    - CTA said that some homes might be affected and explained that whether houses will be affected or not depends on conversations with Union Pacific. CTA also stated that it will work with Union Pacific to discuss issues, such as the Union Pacific's need to have 50 feet of clearance between its track and the CTA track.
- **Economic Development**
  Alderman Brookins asked whether there would be an opportunity for businesses to locate near the station.
    - CTA responded that it would consider retail space, but that it was too early in the process to say anything specific.

YOUR RED

Red Line Extension

Meeting Notes

Date: July 25, 2011

Present: Alderman Roderick Sawyer, 6th Ward
George Coleman, CTA
Sonali Tandon, CTA
Lisa Soard (note taker), CWC Transit Group

Time: 1:57 p.m.

Highlights:

CTA staff presented and left a seven-page packet of Red Line Extension materials. The materials and CTA representatives stressed that:

- This extension is part of “Your Red,” which also includes Dan Ryan Track Renewal and the North Red and Purple Modernization projects.

- The extension will begin at the 95th Street Station and either terminate just north of 130th Street or east of Altgeld Gardens. It also will help South Side residents save 20 minutes on their commute from 130th Street to downtown and reduce the need for transfers.

- All four proposed stations would have park and ride facilities. No park and ride lot would be added to the 95th Street Station. The extension would be elevated from 99th Street to 119th Street and after that it would be at-grade.

- Between 2006 and 2009, planners worked with the community to examine several options for alignment of the extension. Based on those discussions and studies, the Union Pacific Railroad alternative was chosen as the Locally Preferred Alternative (LPA).

- The CTA is in the Environmental Impact Study (EIS) phase of the project as it collects information about how plans would affect local community members and the environment. The August 2nd Open House is part of the EIS phase and will allow community members to have informal discussions with CTA representatives about the proposed extension.

- Funding for the EIS was announced this morning by Senator Richard Durbin. CTA still needs funding for construction and operation of the extension.

Overall Alderman Sawyer is supportive of the plans. He said that the South Side is long overdue for better access to public transportation and he is happy to see that plans are moving forward. Alderman Sawyer is most interested in what is happening at the 95th Street Station and the Dan Ryan Track Renewal project because they are in his ward.

Alderman Sawyer had questions and suggestions about the Red Line Extension.

- **Train Stations**
  He mentioned that the 95th Street Station is a huge hub that needs improvements. He also said that there is a desire in the community to see the Red Line stops in his ward modernized. He asked about whether CTA was considering making improvements to the stops in his ward (69th, 79th, 87th, and 95th streets).
  - CTA responded that one of the alternatives was expanding the 95th Street Station and improving bus service. CTA said that it would like to walk through the four stations with him to hear about what he and the community would like improved. CTA also would like to talk with him about the new adopt-a-station program.

- **Next Steps**
  He wanted to know when the EIS would be complete and what funding CTA had or needs to move forward with the extension.
  - CTA replied that in order to construct and operate the RLE it needs to have funding in place and would need federal approvals. CTA also mentioned that it would take two to three years to finish the EIS, and if everything is in place it could be seven to eight years from now, at the earliest, that the RLE could be operating.

- **Economic Development**
  He asked if there would be opportunities for local contractors to get involved with the construction of the RLE. He also wants to make sure that retailers can locate near the stations. He explained that he couldn’t even buy a newspaper by the 69th Street Station.
  - CTA representatives said that local contractors would be considered during the construction phase and that it would consider retail possibilities.

YOUR RED

Red Line Extension

Meeting Notes

Date: July 27, 2011

Present: Cook County Commissioner Joan Patricia Murphy, 6th District
Sonali Tandon, CTA
Maria-Teresa Roman, CTA
Lisa Soard (note taker), CWC Transit Group

Time: 3:10 p.m.

Highlights:

CTA staff presented and left a seven-page packet about the proposed Red Line Extension (RLE). The materials and CTA representatives stressed that:

- This extension is part of “Your Red,” which also includes Dan Ryan Track Renewal and the North Red and Purple Modernization projects.

- CTA is partnering with the Federal Transit Administration on the extension.

- The extension will begin at the 95th Street Station and either terminate just north of 130th Street or east of Altgeld Gardens. It also will help South Side residents save 20 minutes on their commute from 130th Street to downtown and reduce the need for transfers.

- All four proposed stations would have park and ride facilities. The extension would be elevated from 99th Street to 119th Street and after that it would be at-grade.

- Between 2006 and 2009, planners worked with the community to examine several options for alignment of the extension. Based on those discussions and studies, the Union Pacific Railroad (UPRR) alternative was chosen as the Locally Preferred Alternative (LPA).

- The CTA is in the Environmental Impact Study (EIS) phase of the project and it will examine at least four alternatives and collect information about how plans would affect local community members and the environment. The August 2nd Open House is part of the EIS phase.

- Funding for the EIS was announced Monday by Senator Richard Durbin. CTA still needs funding for construction and operation of the extension.

Commissioner Murphy is in favor of the extension and mentioned she is happy to help however she can at the county level. Murphy knows a lot about transportation and supports high-speed rail to and from Chicago. Murphy had questions and suggestions about the Red Line Extension.

- **Union Pacific Railroad**
  Commissioner Murphy asked how CTA is working with Union Pacific because she knew of a high-speed rail plan that also relied on using the Union Pacific Railroad right-of-way. She suggested that perhaps the high-speed rail could be above ground and the RLE could be below ground. She also said that she thought Union Pacific had 600 feet of right-of-way, which led her to inquire about how much space CTA needs for its track and platforms.
  - CTA said that it prefers the UPRR alternative, and is working with Union Pacific to discuss issues, such as the Union Pacific's need to have 50 feet of clearance between its track and the CTA track. The CTA representative told Murphy she would have to get back to Murphy about how much space CTA would need for its track and platforms.

- **Safety**
  Commissioner Murphy voiced her concern about keeping people and property safe if the RLE ends near Altgeld Gardens. She asked if the terminal station could be moved further east or west. She also suggested a paid monthly pass to park in a fenced, secure lot near the terminal.
  - CTA responded that safety is a top priority and that part of the EIS would review safety.

- **130th Street Terminal**
  Commissioner Murphy questioned why CTA was stopping the RLE at 130th and why CTA wouldn't take the extension further south.
  - CTA said that the extension stops at the city's southern border, which is 130th Street. The CTA staff also explained that south of 130th is a forest preserve. In order to justify extending the line south of 130th, CTA would have to go all the way to 159th Street where there is more population density.

Meeting Notes

Date: July 21, 2011

Present: John Paul Jones, Developing Communities Project (DCP)
Phyllis Palmer, DCP
Eugene X*, DCP
Elder X*, DCP
Lou Turner, DCP
Reagan Robinson, student leader from DCP
Kevin Austria, student leader from DCP
Lee Melis, student leader from DCP
Andre X*, student leader from DCP
Centrall X*, student leader from DCP
Shonay Jackson, student leader from DCP
Naomi Mitch, student leader from DCP
Tiara X*, student leader from DCP
Diane Williams, Parent Leadership in Action Network (PLAN)
Christina Willis, PLAN
Chelsea Smith, PLAN
George Coleman, CTA
Sonali Tandon, CTA
Jeffrey Sriver, Chicago Department of Transportation
Lisa Soard (note taker), CWC Transit Group

Time: 11:00 a.m.

The Red Line Extension (RLE) meeting was preceded by a discussion about general environmental issues that included a mention of the RLE. More focused discussions on RLE followed as described below.

Highlights:

CTA staff showed a seven-slide PowerPoint presentation and a map of the proposed RLE. The presentation and CTA representatives stressed that:

- This extension is part of the “Your Red” Program, which also includes Dan Ryan Track Renewal and the North Red and Purple Modernization projects.

- Since the 95th Street Station is a highly used terminal and the area south of the Red Line has a need for more transit options, CTA is pursuing this extension.

* The “X” means we were unable to obtain the last name of the participant.

- Better transit would spur economic revitalization along the current Red Line and the extension.

- The extension will begin at the 95th Street Station and either terminate just north of 130th Street or east of Altgeld Gardens. It also will help South Side residents save 20 minutes on their commute from 130th Street to downtown and reduce the need for transfers.

- Between 2006 and 2009, CTA worked with the community to examine several options for placement of the extension. Based on those discussions and studies, the Union Pacific Railroad alternative was chosen as the Locally Preferred Alternative (LPA).

- The CTA is in the Environmental Impact Study (EIS) phase of the project as it collects information about how plans would affect local community and the environment. The August 2nd Open House is part of the EIS phase.

Overall DCP is supportive of the plans. The organization reminded CTA that it has been working on this extension for about 20 years. They see that the CTA's transportation projects are being compared to other projects in major U.S. cities, and they want to make sure CTA stays on schedule and doesn't fall behind other cities. They also want to know what they can do to help CTA move the Red Line Extension forward and want to keep the community motivated to help this process.

DCP had questions and suggestions abut the Red Line Extension.

- **Elevation**
  DCP asked if the whole extension will be elevated.
  - CTA responded that only part of it would be elevated up to 119th Street, after which it will become at-grade. CTA clarified that three of the four proposed new stations would be elevated and the terminal station at 130th would be at-grade.

- **Affect on Parks and Housing**
  DCP expressed concern about park land being taken for the extension and explained that the portions that would be impacted are used by families for picnics. DCP would like to work with CTA and the community to see where new green space could be found.
  - CTA representatives said that ideally CTA would like to operate in the existing railroad right-of-way, and will work with the railroad to minimize impacts to parks and homes.

- **Union Pacific Railroad**
  A DCP representative wanted to know if CTA was talking to the Union Pacific about the UPRR alternative.
  - CTA said that it has had some conversations with Union Pacific and that those conversations are ongoing.

- **Alternatives**
  In addition to asking for a reminder about the different alternatives to consider during the EIS, DCP also asked why other alternatives were still being considered when the CTA and the community had already chosen the UPRR as the LPA. DCP also reminded the CTA that noise is a concern and that they particularly supported the UPRR alternative because the noise wouldn't be as bad in its opinion.
    - CTA described each of the three other alternatives: No Build, Transportation System Management, and Halsted Street. CTA representatives also reminded DCP that each of the proposed new stations would include park and ride lots and bus transfer facilities. To answer the question about why other alternatives are still being considered, CTA said that it is required by the Federal Transit Administration (FTA).

- **Funding for EIS**
  DCP wanted to know when the EIS would be complete and what funding CTA had to move forward with the extension. They also asked how much money would be needed to complete the EIS.
    - CTA responded that in order to go any further they needed funds to prepare the Draft EIS and identify funds for construction and operation. CTA said it would continue to work with FTA and elected officials to identify funds. The August 2nd Open House is planned so that residents can see the results from the first scoping meeting and see that CTA is moving forward. CTA said that they would need \$3 million to \$5 million to complete the EIS and approximately \$30 million to finish preliminary engineering. CTA also mentioned that it would take two to three years to finish the EIS.

- **Livable Communities Grant**
  DCP asked whether the CTA was working with CMAP to pass a city ordinance that would give CTA \$1 million of a \$4.25 million grant from CMAP to study the Red Line Extension. DCP seemed confident that this ordinance would move forward and said they testified at the July 15th CTA Board meeting about the ordinance.
    - CTA representatives said they were unfamiliar with the ordinance, but they would look into it and continue to work with other partners for funding.

- **Your Red**
  There was a concern among DCP representatives that several projects were getting piled into one program – "Your Red" – and that may slow down the Red Line Extension.
    - CTA responded that there are three separate projects and that the Red Line Extension is following the New Starts process.

- **Open House**
  DCP asked if there was anything they could do during the Open House to help move the process forward.
    - CTA said that the comments received from the community during the Open House will be considered when drafting the EIS.

YOUR RED

Red Line Extension

Meeting Notes

Date: July 26, 2011

Present: Ledall Edwards, Executive Director, Roseland Business Development Council
George Coleman, CTA
Sonali Tandon, CTA
Lisa Soard (note taker), CWC Transit Group

Time: 10:20 a.m.

Highlights:

CTA staff presented a seven-page packet about the proposed Red Line Extension. The materials and CTA representatives stressed that:

- This extension is part of "Your Red," which also includes the Dan Ryan Track Renewal and the North Red and Purple Modernization projects. In addition, any improvements made to one part of the Red Line help the entire line.

- The extension will begin at the 95th Street Station and terminate either just north of 130th Street or east of Altgeld Gardens. It also will help South Side residents save 20 minutes on their commute from 130th Street to downtown and reduce the need for transfers.

- All four proposed stations would have park and ride facilities. The extension would be elevated from 99th Street to 119th Street and after that it would be at-grade.

- Between 2006 and 2009, planners worked with the community to examine several options for alignment of the extension. Based on those discussions and studies, the Union Pacific Railroad (UPRR) alternative was chosen as the Locally Preferred Alternative (LPA).

- The CTA is in the Environmental Impact Study (EIS) phase of the project as it examines four alternatives and collects information about how plans would affect local community members and the environment. The August 2nd Open House is part of the EIS phase.

- Funding for the EIS was announced yesterday by Senator Richard Durbin. CTA still needs funding for construction and operation of the extension.

Overall Mr. Edwards and the Roseland Business Development Council (RDBC) are supportive of the plans. He suggested that CTA come back during RBDC's next quarterly meeting to give all members an update. Edwards had questions and suggestions about the Red Line Extension.

- **Community Support**
  Mr. Edwards asked if the CTA had community support for this extension. He also mentioned that he has been hearing some concerns about noise from the community.
    - CTA affirmed that the community supports this extension, particularly the UPRR alternative because it goes to Altgeld Gardens. CTA said that it is working with UPRR to discuss issues, such as the UPRR's need to have 50 feet of clearance between its track and the CTA track. CTA responded to the noise concern by reminding Mr. Edwards that it will be looking at noise impacts during the EIS.

- **Funding**
  He asked if CTA anticipated having problems getting the funding needed to make this extension a reality.
    - CTA said that identifying funding will be a challenge. CTA also explained that in order to construct and operate the RLE, the CTA will need to have funding in place first, and then the project would need federal approval.

- **Economic Development**
  Mr. Edwards asked about the look of the 115th Street Station, since that would be closest to his business. He asked if it would mirror the 95th Street Station. He wanted to make sure there would be an opportunity for businesses to locate near the station so that passengers might go even further to the retail strip and his business on South Michigan Avenue.
    - CTA responded that it would consider retail space, but that it was too early in the process to say anything specific. CTA also said that all new stations would have park and ride lots.

- **Timeline**
  He also asked about when to expect the RLE to be up and operating.
    - CTA mentioned that it could take two to three years to finish the EIS, and if everything is in place (funding and federal approval) it could be seven to eight years from now, at the earliest, that the RLE could be operating.

- **Effect on Environment and Housing**
  Mr. Edwards wanted to know how the RLE would impact the environment, and if any homes would be demolished.
    - CTA said that some parks might be affected, as well as homes. CTA explained that whether houses will be affected depends on conversations with UPRR. And, CTA officials reminded Mr. Edwards effects to historical properties will be analyzed during the EIS.

Meeting Notes

Date: August 8, 2011

Present: Representative Cynthia Soto, 4th District
Joe Iacobucci, CTA
Sonali Tandon, CTA
Deborah Lopez, CTA
Lisa Soard (note taker), CWC Transit Group

Time: 8:53 a.m.

Highlights:
CTA staff presented information about the Red Line Extension (RLE) and left a seven-page packet for Representative Soto to reference, as needed. CTA representatives emphasized that:

- This extension is part of "Your Red," which also includes Dan Ryan Track Renewal and the North Red and Purple Modernization (RPM) projects.

- The extension will begin at the 95th Street Station and terminate either just north of 130th Street or east of Altgeld Gardens. It will help South Side residents save about 20 minutes on their commute from 130th Street to downtown and reduce the need for transfers.

- All four proposed stations would have park and ride facilities. The extension would be elevated from 99th Street to 119th Street and after that it would be at-grade.

- Between 2006 and 2009, planners worked through the Alternatives Analysis process. Based on discussions with the community and studies, the Union Pacific Railroad alternative was chosen as the Locally Preferred Alternative (LPA).

- Although Senator Durbin recently announced federal money to complete the EIS for the RLE and RPM projects, CTA would still need federal, state, and local funds for design and construction of the RLE.

- The CTA is in the Environmental Impact Study (EIS) phase of the project as it collects information about how plans would affect residents and the environment. CTA conducted an Open House on August 2nd to allow community members to ask CTA representatives about the proposed extension.

Representative Soto said CTA is doing good things and that she likes this project. She appreciated that CTA came out to brief her, but mentioned that she felt CTA should be doing more advertising and community events to raise awareness about this project. She also said she hoped that minority participation in construction would be high.

Representative Soto had questions and suggestions about the Red Line Extension.

- **130th Street Terminal**
  Representative Soto asked if CTA had future plans to extend the Red Line beyond 130th Street.
  - CTA said that it would need to go through another EIS process before it considered extending beyond 130th Street, and that it had to get the RLE approved and built first.

- **Timing and Funding**
  Representative Soto wanted to know how long the CTA had been working on the RLE. She also asked about whether any of the federal money for high speed rail could be used for the RLE, whether CTA got any capital dollars, and how much CTA would need to complete the RLE. She emphasized that she would be meeting with Transportation Secretary Ray LaHood soon, which could help inform where funding should be directed.
  - CTA replied that it had been working on the RLE since 2006. CTA stated that no federal money for high speed rail could be used on this project, but that the RLE was going through the “New Starts” funding process for new rail projects. CTA answered that it had received some capital funds, but those were to keep the existing system in a state of good repair, and would not address the RLE. CTA also said that its original 2009 estimate to complete the RLE was $1.1 billion, but that will likely rise with inflation.

- **Feasibility**
  Representative Soto asked if CTA had completed a feasibility study for the RLE.
  - CTA explained that a preliminary feasibility study was completed as part of the Alternatives Analysis phase, and that a more comprehensive feasibility study would be part of the next steps in the preliminary engineering phase.

YOUR RED | Red Line Extension

Meeting Notes

Date: July 28, 2011

Present: Rick Bryant, Chief of Staff, Representative Jesse Jackson, Jr., 2nd District
Joe Iacobucci, CTA
Michael McLaughlin, CTA
Deborah Lopez, CTA
Lisa Soard (note taker), CWC Transit Group

Time: 10:40 a.m.

Highlights:
CTA staff presented and left a seven-page packet of Red Line Extension (RLE) materials. The materials and CTA representatives stressed that:

- This extension is part of "Your Red," which also includes Dan Ryan Track Renewal and the North Red and Purple Modernization (RPM) projects.

- The CTA is taking a balanced approach to the Red Line; roughly half the money announced by Sen. Durbin recently will go to the EIS for the RLE and half to RPM.

- The CTA is partnering with the Federal Transit Administration (FTA) on the RLE.

- The extension will begin at the 95th Street Station and terminate either just north of 130th Street or east of Altgeld Gardens. It also will help South Side residents save 20 minutes on their commute from 130th Street to downtown and reduce the need for transfers.

- All four proposed stations would have park and ride facilities. The extension would be elevated from 99th Street to 119th Street and after that it would be at-grade.

- Between 2006 and 2009, planners worked through the Alternatives Analysis process. Based on discussions with the community and studies, the Union Pacific Railroad alternative was chosen as the Locally Preferred Alternative (LPA).

- The CTA is in the Environmental Impact Study (EIS) phase of the project which will collect information about how plans would affect local community members and the environment. The August 2nd Open House is part of the EIS phase and will allow community members to ask CTA representatives about the proposed extension.

Mr. Bryant said CTA is doing good work and that he has been impressed with the CTA's commitment to this project. Mr. Bryant also said he and Representative Jackson, Jr., will support the community's decision for the LPA. Mr. Bryant had questions and suggestions about the Red Line Extension.

- **Union Pacific**
  Mr. Bryant asked if CTA and the Chicago Department of Transportation were able to work with the UP to vacate its track or move to the Canadian National line, would the CTA use the UP's track?
    - CTA said that it would still build an elevated track. CTA also said that it would continue to work with the UP because the UP has several concerns. For example, the UP may consider adding a third track, and the UP wants to make sure that it doesn't lose income because this line is its main line to Texas.

- **Timing and Funding**
  He wanted to know when the EIS would be complete and what funding CTA had or needs to move forward with the extension.
    - CTA replied that in order to construct and operate the RLE it needed to have full funding in place and would need federal approval. CTA representatives said that they were looking at a state match and an operating subsidy. CTA also mentioned that it could take two to three years to finish the EIS, and if everything is in place it could be seven to eight years from now, at the earliest, that the RLE could be operating.

- **Halsted Alternative**
  Mr. Bryant asked about the Halsted Alternative and whether it would be elevated.
    - CTA explained that it would be elevated and that it scored just as well as the Union Pacific Railroad right-of-way. CTA is keeping the Halsted Alternative in the EIS for comparison purposes and to meet FTA requirements.

Meeting Notes

Date: July 20, 2011

Present: Representative Monique Davis, 27th District
Deborah Lopez, CTA
Sonali Tandon, CTA
One local resident
Karen Huelsman (note taker), CWC Transit Group

Time: Noon

Highlights:

CTA staff presented and left a seven-page packet of Red Line Extension materials. The materials and CTA representatives stressed that:

- Since the 95th Street Station is a highly used terminal and the area south of the Red Line has a need for more transit options, CTA is pursuing this extension.

- Better transit will spur economic revitalization along the current Red Line and the extension.

- Between 2006 and 2009, planners worked with the community to examine several options for placement of the extension. Based on those discussions and studies, the Union Pacific Railroad alternative, was chosen as the Locally Preferred Alternative.

- The CTA is in the Environmental Impact Study (EIS) phase of the project as it collects information about how plans would affect the local community and the environment. The August 2nd Open House is part of the EIS phase.

Overall Representative Davis was supportive of the plans, and was hopeful that the money can be secured to build the extension. Since the state government will have to contribute a portion of the funding, she noted that there is a lot of work ahead.

Representative Davis had questions and suggestions abut the Red Line Extension.

- **Safety**
  She said one of her biggest concerns is that people feel safe riding the train. She suggested looking at what other cities do to address these concerns.
    - CTA answered that security personnel and cameras could address safety concerns.

- **Community Involvement**
  She said many in her district feel forgotten when it comes to transit. She also stressed the need for keeping the community informed through every step.
    - CTA representatives said this extension is in direct response to the need for more transit options south of 95th Street. If the extension is built, it would eliminate the need for time-consuming transfers. Transit riders traveling from the proposed 130th Street terminal to the Loop would save about 20 minutes.

- **Affect on Housing**
  She was optimistic that the community would support the plan as long as the disruption to housing was minimal and that elevated tracks would not be placed over existing homes in the area. In addition, she was concerned about toxic train emissions too close to housing. A resident also was concerned if the extension would serve residents of Altgeld Gardens. The resident also asked where tracks would be placed in relation to existing structures.
    - CTA representatives responded that the extension would serve Altgeld Gardens and that ideally CTA would like to operate in the existing railroad right-of-way, and will work with the railroad to minimize effects on residents.

Meeting Notes

Date: July 29, 2011

Present: Senator Martin A. Sandoval, 12th District
Sean J. Murray, chief of staff, Senator Sandoval
Sonali Tandon, CTA
Joe Iacobucci, CTA
Deborah Lopez, CTA
Joan Coogan, CTA
Lisa Soard (note taker), CWC Transit Group

Time: 1:05 p.m.

Highlights:
CTA staff presented and left a seven-page packet of Red Line Extension (RLE) materials. The materials and CTA representatives stressed that:

- This extension is part of "Your Red," which also includes Dan Ryan Track Renewal and the North Red and Purple Modernization (RPM) projects; and that when improvements are made to one part of the line it helps the whole line.

- The CTA is partnering with the Federal Transit Administration (FTA) on the RLE.

- The extension will begin at the 95th Street Station and terminate either just north of 130th Street or east of Altgeld Gardens. It also will help South Side residents save 20 minutes from 130th Street on their commute to downtown and reduce the need for transfers.

- All four proposed stations would have park and ride facilities. The extension would be elevated from 99th Street to 119th Street and after that it would be at-grade.

- Between 2006 and 2009, planners worked through the Alternatives Analysis process. Based on discussions with the community and studies, the Union Pacific Railroad (UPRR) alternative was chosen as the Locally Preferred Alternative (LPA).

- The CTA is in the Environmental Impact Study (EIS) phase of the project which will collect information about how plans would affect local community members and the environment. The August 2nd Open House is part of the EIS phase and will allow community members to ask CTA representatives about the proposed extension.

Senator Sandoval was pleased to see progress on the RLE. He said people are really getting excited about this extension and that CTA and its supporters need to get the federal government to help move this forward. He also mentioned that he would try to get to the open house and asked to keep getting briefings as this process moves forward.

- **130th Street Terminal**
  Senator Sandoval mentioned that the unions have asked him if the CTA is considering extending the Red Line beyond 130th Street. The unions seem to think there is a greater ridership at 159th Street.
  - CTA representatives explained that the "New Starts" process, which is the process the CTA is going through for the RLE, is very competitive and that the projects considered need to be cost effective. The CTA staff also said that south of 130th is a forest preserve, which is low density for ridership. In order to justify extending the line south of 130th, CTA would have to go to where there is more population density.

- **Timing and Funding**
  He wanted to know when the EIS would be complete and what funding CTA had or needs to move forward with the extension. Senator Sandoval also asked how much the CTA got from the federal government, which Senator Durbin announced recently.
  - CTA replied that in order to construct and operate the RLE it needed to have full funding in place first and then it would need federal approval. CTA representatives said that they were looking at a 50/50 federal-local match, which could be a combination of city and state funding.

    CTA also mentioned that it could take two to three years to finish the EIS. After the EIS, CTA would focus on engineering and design, and if everything (including funding) is in place it could be seven to eight years from now, at the earliest, that the RLE could be operating.

    Additionally, CTA explained that roughly half the money announced by Senator Durbin recently will go to the EIS for the RLE (approximately $3 million) and half to RPM. CTA added that it would cost about $1.4 billion to construct RLE.

- **City Elected Official Support**
  Senator Sandoval asked who the transportation chair was at the city level and whether that person had hearings on the RLE. He also asked about the wards that the RLE would go through and whether the aldermen supported it. In addition, he asked if the CTA chairman and president, and Chicago's new mayor were aggressively seeking funding. He followed that up by asking if the mayor had transportation in his transition report.
  - CTA said that the transportation chair was Alderman Anthony Beale and that he hadn't hosted hearings yet. CTA also said that they had briefed all of the aldermen who would have the RLE in their wards and that all have voiced support. CTA affirmed that the CTA chairman and president, and Mayor Emanuel were aggressively seeking funding for the RLE, and that transportation was in the transition report.

- **Effect on Property and Environment**
  Sandoval asked about the impact on the environment and whether any housing would be affected.
    - CTA replied that the UPRR alternative could have minimal impacts on property and some impact on parks; the impacts would be evaluated in EIS. CTA also said that it is working with the Union Pacific because the UP has requested a 50-foot buffer between its tracks and the extension.

YOUR RED

Red Line Extension

Meeting Notes

Date: July 20, 2011

Present: Senator Emil Jones III, 14th District
Deborah Lopez, CTA
Sonali Tandon, CTA
Karen Huelsman (note taker), CWC Transit Group

Time: 1:40 p.m.

Highlights:

CTA staff presented and left a seven-page packet of Red Line Extension materials. The materials and CTA representatives stressed that:

- Since the 95th Street Station is a highly used terminal and the area south of the Red Line has a need for more transit options, CTA is pursuing this extension.
- Better transit will spur economic revitalization along the current Red Line and the extension.
- Four new transit stations with parking facilities are planned for the extension.
- Between 2006 and 2009, planners worked with the community to examine several options for placement of the extension. Based on those discussions and studies, the Union Pacific Railroad alternative was chosen as the Locally Preferred Alternative.
- The CTA is in the Environmental Impact Study (EIS) phase of the project as it collects information about how plans would affect the local community and the environment. The Aug. 2 Open House is part of the EIS phase.

Senator Jones was very supportive of the proposal, saying, “We want to get this done.” He said that he was planning to attend the Open House on Aug. 2.

He had questions and suggestions abut the Red Line Extension.

- **Park Land and Homes that Would be Affected**
  He expressed concern that the community would be reluctant to give up any park space for more transit tracks. He also mentioned that if housing would need to be razed then that could be a challenge to the community.
  - Within the locally preferred option, the CTA pointed out that different parks would be affected depending on whether the CTA tracks were built East or West of the Union Pacific Railroad's existing tracks. Likewise, different housing units could be affected. Ideally CTA would like to operate in the existing railroad right-of-way, and will work with the railroad to minimize land acquisition.

- **Length of Time for Completion and Costs**
  Senator Jones said that he and his community have been waiting a long time for more transit, and that he was unaware completion could be eight years away. His biggest funding concern, upon hearing the project could cost $1.1 billion, was coming up with the state's portion of the funding. But he was optimistic about the CTA being able to secure the funding and that he had already talked with Gov. Quinn about supporting the project.
  - CTA explained that the proposed extension would require federal, state and local funding.

- **How This Would Help Commuters**
  Senator Jones was pleased that transit riders would not have to make any transfers to travel from 130th Street to the Loop, and that the extension would reduce about 20 minutes off that trip.
  - CTA staff pointed out that reduced commuting time would make travel more convenient for those who have jobs or are looking for jobs downtown. Coupled with the park and ride facilities, the project would be an economic booster for local businesses along the line as well.

Re: CTA Red Line Extension Environmental Review Process Update

Dear *[Agency Representative]*:

The Federal Transit Administration (FTA), in cooperation with the Chicago Transit Authority (CTA), has completed scoping in preparation for the development of an Environmental Impact Statement (EIS) for the proposed Red Line Extension project. This project would extend the Red Line, a rail transit line, 5.3 miles from its existing 95th Street Station to a new terminal station at 130th Street. Future project development is subject to available funding.

CTA will be hosting an open house on August 2, 2011 from 6:00 p.m.to 8:30 p.m. at St. John Missionary Baptist Church, 211 E. 115th Street, Chicago, IL to update the community on the results of the scoping process and on project progress. Your agency is cordially invited to attend this update meeting. CTA continues to receive feedback on the project and potential effects which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and CTA staff. There will be no formal presentation or testimony.

The EIS scoping process included an agency scoping meeting on September 24, 2009 and two public scoping meetings on September 22, 2009, and September 24, 2009. The scoping comment period ran from September 1 to October 27, 2009. Input received on the project from both agencies and the public is summarized in the scoping report dated June 2010. Agencies, community groups, members of the public, elected officials, and other interested parties submitted 316 letters, e-mails, and comment cards, and 28 individuals provided oral testimony during this period. The scoping report can be accessed at http://www.transitchicago.com/Redeis/documents.aspx.

The comments that were received will be used to guide the analysis in the Draft EIS. Preliminary evaluations have also identified potential issues that will likely require coordination and further study regarding parks, utilities, I-94 and I-57, and acquisitions.

As the project moves forward and the Draft EIS is developed, as a participating agency, you may be asked to:

- Provide input on the impact assessment methodologies and level of detail in your agency's area of expertise;
- Participate in coordination meetings, conference calls, and joint field reviews, as appropriate; and
- Review and comment on sections of the pre-draft or pre-final environmental documents to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, and the anticipated impacts and mitigation.

If you have questions regarding this process, please contact either:

Please provide your comments about the proposed alternatives to extend the Red Line south to the vicinity of 130th Street.

My most concern is that as we moved through this planning and EIS phases - I would like to see more inter-governmental planning coordinated. Also, that the density and activity (busiest station in the system) 95th Street Red-Line station be identified as a transportation HUB. As part of the Red-Line Oversight Committee, I truly hope that city government continues to make this project a priority Equity in transportation development projects and community needs (does really matter). Referenced the the Voorhees (UIC) + DCP report. We want to be sure this opportunity does not get lost in politics. We have to move forward and the commitments that our politicians have made - including the Mayor - This project must remain a priority and on the front-lines.

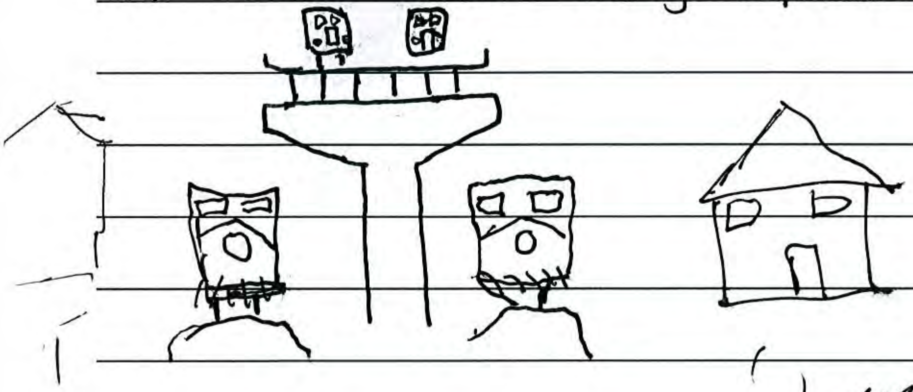
Please provide your comments about the proposed alternatives to extend the Red Line south to the vicinity of 130th Street.

The proposed route adjacent to UP RR seems like a good route. Will it be east or west of the UP RR tracks. IF it ran above the UPRR or on existing tracks I think that will save a lot of homes from being razed



HRT (Rail) Alternative is definitly a NoNo. please do not take the sun from us along Halsted St

1 Please provide your comments about the proposed alternatives to extend the Red Line south to the vicinity of 130th Street. I firmly believe that a high speed electric trolley bus similar to Boston Massachusetts Green Line (down a modified Eggleston Avenue in Chicago) could've been less expensive to build and quicker to implement. It, as I envisioned it, also would've run parallel to UPRR

2 I DO NOT BLAME THE CTA FOR FOOTDRAGGING on constructing the Red Line Extension. From a business standpoint it would be foolhardy to invest in an area where graffiti and vandalism is common, assaults on women and girls could easily occur at the construction sites, and finally - CTA riders FLOUT advisories against eating, littering, radio playing and smoking on vehicles

Please provide your comments about the proposed alternatives to extend the Red Line south to the vicinity of 130th Street.

I AM IN AGREEMENT THAT AN EXTENSION TO THE RED LINE TO 130TH ST. IS MUCH NEEDED. FROM WHAT I AM HEARING, IT DOESN'T HAVE A CHANCE ON BECOMING A REALITY FOR THE NEXT 10 TO 20 YRS. I AM CONCERNED THAT WITH WHAT YOU CURRENTLY HAVE, TRAVEL ON THE RED LINE FROM 95TH ST. TO DOWNTOWN HAS BECOME PAINFULLY SLOW DUE TO LACK OF MAINTENANCE TO THE TRACKS. ANOTHER CONCERN OF MINE IS THAT WHEN I VISITED OTHER CITIES WITH RAPIT TRANSIT OR LIGHT RAIL SYSTEMS, PARKING IS AMPLE. ON THE RED LINE, THE ONLY PARKING FACILITY IS HOWARD ST. UNTIL OR IF EVER THIS EXTENSION HAPPENS, I ~~[illegible]~~ WOULD LIKE TO SEE THE TRACKS IN A STATE OF GOOD REPAIR SO THE TRAVEL TIME WOULD BE REDUCED TO NO MORE THAN 25 MINUTES FROM 95TH TO THE LOOP. WITH THE TRAVEL TIME BEING SO SLOW, I HAVE EITHER DRIVEN TO THE LOOP OR HAVE OPTED TO RIDE METRA OR THE SOUTH SHORE LINE SINCE IT GETS YOU FROM THE FAR SOUTH SIDE TO DOWNTOWN IN APPROXIMATELY 30-35 MINUTES

(8)

Proposed Red Line Extension to 130th Street

The Red Line Extension to 130th & Bishop Ford/I-94 is a wholly unnecessary and wasteful expenditure.

- The hundred million dollars for the Red Line extension represents a costly duplication of existing and nearby Metra and Northern Indiana Commuter Transportation District services to the South Suburbs.
- Suburban buses could be routed just as easily and more efficiently to existing suburban stations at 115th/Kensington, Riverdale, or Hegewisch or to a new station on the NICTD South Shore Line at 130th & Bishop Ford.
- The extension and station at 130th bypassing Roseland would be relevant to very few City residents that couldn't use existing Metra, NICTD and Pace services.
- Existing Pace services to 95th do not extend much beyond Harvey or into Indiana and do not afford the reach into distant suburbs provided by Metra and NICTD.
- Metra Electric offers nearly as many connections to east-west CTA buses across the South Side as the Red Line and Green Line combined, and to CTA trains downtown.
- If Metra Electric frequency is a community issue, add trains.
- If Metra Electric fares are an issue, incorporate Metra South Chicago and Blue Island and NICTD South Shore lines in the City into the CTA system as the Gray Line.
- The 2-person Metra crew represents a savings over the CTA 1-person crew and manned stations.
- The CTA extension would attract few if any new transit users without park-n-ride in addition to a bus transfer terminal. Parking facilities and a station could be built just as easily on the South Shore without a CTA rail extension.
- The CTA extension seeks to divert existing transit users from other services with lower fares that willfully increase its operating deficit. The premise seems to be that increasing the deficit raises the amount of State funding that can be brought into the City. There is complete disregard for regional fiscal responsibility and accessibility need priorities for transit.
- The only value in constructing the extension is in the State and Federal dollars brought into the City; and that competes with needs, some desperate, elsewhere.
- In a related matter, extending Metra/Gray Line local service to Hegewisch would open capacity for NICTD South Shore service growth to Northwest Indiana while facilitating expanded bus-rail transfers. Tracks used by the South Shore from the State Line are owned by Metra.

Subject: Re: [CHICAGOTRANSIT] Re: Red Line 130th extension

In the first place, you totally ignore existing transit infrastructure in the area that could be exploited more fully for less money.
The bus volume into 95th is more artificial and competitive than economic. While the service in Chicago is understandable, the number of Pace routes incurs significant additional mileage to feed the CTA than the nearest suburban Metra station whose service would be faster. These extra miles are not free of expense, consuming resources and limiting the ability to expand into unserved areas.
As I see it, a CTA extension to 130th would shorten the Pace feeder routes and avoid expressway congestion approaching 95th to be more compete on fare and travel time to poach Metra riders at a cost of a $-billion. I suspect that the cost for the length of trip for such service is above the system average and represents a subsidy equal to or greater than that for Metra.
The CTA Red Line Extension intermediate station volumes projected to be quite low, comparable to those proposed to be closed in a Red Line reconstruction between Clark Jct & Howard. Even so, the volumes probably include a fair number of Metra customers diverted from the nearby Electric and Rock Island stations (didn't get a feel for those numbers from the study).
Yes, a transfer is required to continue north; but is the cost of a parallel line worth the new or diverted Metra riders attracted to the Red Line bound for north of the Loop?
Yes, in principal the Red Line should extend from the northern to the southern corporate limits; but given the existence of other alternatives, is this a responsible use of capital resources?
Finally, the proposed CTA extension would not tie in with Metra to reach suburban destinations, obliging parallel competing Pace-CTA services with a limited pot of dollars for operations.

> I've been sitting back trying to understand why so many are against the red line being extended. Isn't 95th like the 2nd busiest station in the entire system? Doesn't that warrant an extension since so many buses feed into that terminal? None of the buses with the exception of the 29 cross another CTA rail line so people that take the bus out there don't have another option to get downtown and points beyond other than the red line. I used to have to take that long ride from the suburbs by the 352 or 353 daily and running the red line further south would eliminate a good portion of my commute. If I still lived out there I probably wouldn't take the 352 considering I don't see how that bus would end up anywhere but at 95th but the 353 was always my preferred bus and it would make sense for me to take that. While I can see the fight for the gray line, I think it is somewhat limited for what the red line extension is trying to do. If my final destination was downtown, then yes that would work but if I was

(10)

trying to go elsewhere, Lakeview or points north or west, that creates an unnecessary transfer with a walk from Millennium Station to Wabash or State to the appropriate train. And before anyone jumps up and chews my head off, I'm just searching for clarification not a debate.

Congestion of vehicles or people? Wouldn't it be a lot cheaper to build a big parking garage at 95th with a huge bus terminal on the ground floor?

> The extension is needed to provide service to the most isolated
> area in the city.

Isolated? It's squeezed in between two Metra lines with stations every half mile. Do you think folks in Scottsdale, Sauganash, Montclare, Mount Greenwood, or Garfield Ridge would agree that Roseland is "the most isolated area in the city?"

The bigger problem is that the Red Line extension area is low density. Roseland, West Pullman, and Pullman are all under 11,000 persons per square mile. For comparison, South Shore is 21,000, Lake View is 30,000.

Just how would FRA regs be any different with the Gray line since Metra would continue to operate its trains on its plant for a CTA service? Or continue to operate as Metra with an integrated RTA fare system?
The other advantage of the Gray Line is that Metra is not eligible (directly) for revenue from the dedicated RTA sales tax generated in the City. CTA could use this to purchase service from Metra, thereby making Metra whole. The suburban-generated tax revenue could be shifted to CTA mitigated by the purchase of service, offsetting the added expense of the Gray Line to the CTA.
Further Pace and CTA operating savings may be achieved by orienting buses to feed the Gray Line and Metra Electric rather than going much farther either to Downtown or 95th.

With the Gray Line proposal, #95W-#95E and #103-#106 could be combined and returned to through routes across the South Side and connect with suburban rail services to Joliet, University Park, and Indiana as well as feeding the Gray Line to Downtown.
Have I mentioned before that 130th & Bishop Ford is at the South Shore that could be transformed to a Gray Line branch from Hegewisch?

> The most important fact is that the present 95th Street terminal of the Red line is the most congested in the city and the only way to relieve this is to extend the Red line into those territories feeding 95th. Decades ago planners thought the extension would be both east and west and left space in the two expressway medians. We now know that neither median is the best routing and the concept of the UP ROW or south Halsted competed and the UP won out as the best of both worlds, and undoubtedly the cheaper. The UP does bend east and touches the commercial strip. After crossing the Metra/CN its a surface operation to 130th.
>
> Is 130th a great place for a terminal. It is a good place for parking. Desolate locations can still be secured and there is plenty of potential traffic on the Freeway. Those who want the express to downtown already have Hegwisch and Harvey. 130th can hold a super rail yard. The other "L" lines certainly don't boast packed trains at their end points, so why shpould the Red line be any different.
>
> In short, the extension relieves 95th Street and that can only be done extending the "L". It cannot be done with a "pie in the sky" new Metra service. Of course, we could get Six Flags to develop a winter ski park on that mountain of landfill....that would be in the old tradition of interurban lines that went to a park at the end of the line.

Subject: Re: [CHICAGOTRANSIT] Re: Red Line 130th extension

Trains are trains and railways are railways; that's why some metropolitan systems like BART, Metro, and others act as regional services in outlying areas, and why Metra (electric and diesel) could serve as metropolitan lines in Chicago. There may be service characteristics that distinguish equipment needs; but these often are in conflict and less than ideal for different market segments. The CTA-Metra distinction is functionally artificial and political.
The provision for seating on rapid transit was made early on. Later, center doors and bowling alley seating were added for the relatively short runs, high loads, and constrained capacity of the Loop. Quarter-point doors improved access within the cars; and the State and Dearborn subways relieved the limited capacity of the Loop and the need to pack as many passengers as possible on the trains. Basically, I'm opposed to building a costly parallel rapid transit line to serve much the same area as an existing and underutilized rail line that could be exploited for much less money.

> 130th ST maybe was picked out of a hat. It puts Altgeld Gardens within walking distance...good for demographics. I have a friend who says the Tribune did a story and 130th ST was given because there was plenty of space for a "super rail yard."
>
> Personally, I am leaning back towards bending the line east to 115th ST and the Ford Freeway. Takes a while to get used to that name "freeway." If the tracks come back along the Metra/CN a connecting station could go in at Kensington, then the "L" goes east to 115th and Ford. You've got the second largest assembly hall and the new WalMart led retail going in there at 115th. There should be plenty of space for the parking facility. You're now a shorter one and a half mile from the college at 103rd and Altgeld is still within reach. Or if needed the line can turn south and go alongside the Freeway and still go to 130th ST.

__,_._,___

- It's obvious that without a stronger, coordinating, hand for RTA, self-serving expansion proposals like the CTA Red Line extension will abound.
- Metra services are categorized *by CTA* as serving longer trips to downtown. As a generalization there some truth to it; but it totally misrepresents the capacity and history for providing the frequent urban service expected in the City.
    - Metra Electric trains and infrastructure have the characteristics of heavy rail transit with multi-stream floor-level boarding and electric traction.
    - The Rock Island Blue Island and Electric South Chicago branches still schedule some rush-hour trains as little as ten and fifteen minutes apart respectively.
    - CTA fares are lower than Metra's and provided little reduction for transfers other than the monthly Link-up pass.
    - The alternative to increase the frequency and reduce the intervals between Metra trains, particularly on the Electric to 115th and Blue Island, is not even considered as it should if RTA were the lead agency.
    - The South Side Elevated Railway Company and Illinois Central Railroad both provided frequent urban rail transit services with similar steam locomotives and coaches. Both electrified and the IC eventually bought larger cars. Both continued to compete with the separate streetcar and bus companies.
    - It wasn't until 1946 when the CTA took over L-subway and surface operations that reduced fare transfers were instituted between the L-subway and surface lines. This drew City riders away from the IC or CRI&P and started the declines in riders and service.
- Much of the reduced Metra (xIC and xCRI&P) service stems from diversion to the CTA owing in part to bus service changes and the Dan Ryan Line construction.
    - The more Metra service was cut back to reflect lower demand, still more riders switched to the CTA.
    - Ridership declines were exacerbated by the deterioration of South Side neighborhoods and declining population that seems to be on the rebound.
    - Buses on 95th and 103rd do not continue across the corridor to facilitate use for passengers that might want to use Metra.Few 1/2-mile east-west CTA routes are available to feed existing Metra stations.
    - CTA bus routes in the study corridor are typically 1-mile apart.
- The report in the Tribune on Wednesday, April 11, 2007 regarding crowding and lack of capacity on the Metra Electric and NICTD South Shore is a shallow, biased, and unfair representation to justify the CTA initiative.
    - Sufficient capacity is available on tracks 2 & 3 for expanded, frequent urban service more extensive than proposed for the Gray Line with South Chicago, Blue Island, and Hegewisch branches.
    - Service to Hegewisch would relieve demand and crowding on the South Shore trains.
    - The Randolph Street terminal can be modified easily enough for the Gray Line and handle demands for frequent service.

  - Alternative reduced 15-minute skip-stop service to Blue Island and Hegewisch would allow reverse-peak Metra and South Shore trains to share tracks 2 & 3 and greatly expand suburban peak capacity for tracks 1 & 4.

Subject:Re: Gray Line Randolph St operation
To: "Adam H. Kerman" <ahk@chinet.com>

A representative evening cycle begins at :00 at the top and proceeds at :02 min intervals. The Gray Line service consists of alternating South Chicago and Blue Island/Hegewisch trains on either a 4-train, 16-minute, or 3-train, 12-minute cycle. Given the additional capacity on the Metra side, continued Metra Blue Island Expresses every 16 minutes and alternating South Chicago and Mainline-Hegewisch trains on respective 8-minute headways for the Gray Line are another option.

Inbound reverse-commute trains would be augmented by equipment pulling out from the 12th St Yard on Track 2 to make up outbound trains. Gray Line would run left-hand on Tracks 2 & 3 in PM, Metra left-hand on Track 1 in AM.

This plan takes advantage of the yard lead between local tracks and the platform between tracks 4 & 5 at Randolph Street that can be isolated for fare control. Reverse running solves the terminal problem that would be more difficult and expensive to rectify; but it poses other issues down the line such as bi-directional signaling, crossovers, and boarding platform for direction of travel.

Extending the Redline is a step in the right direction. Ten-Twenty years ago it would have been an excellent idea! People live and travel well past 130th and much further east and west.

I hope a significant number of minority contractors will ~~not~~ be on board. Jobs provided for local people in the area and how many home-owners will be effected by the extension.

Subject: location of the elevated tracks

Thank you for including me in this breifing. I would like to be informed of where and when the next community input meeting will be held. There are a lot of questions, I have concerned the true location of the elevated tracks, since I live at 115th and State! There is already a train track at the end of the block that has caused structural damage to our home. The addtion of more trains plus the vibrations, noise and traffic that will accompany it are beyond any reasonable plan. Please be more specific in your replies, not just the already available information on the www.

Sincerely,
Stella Brown

Subject: Connecting with Northwest Indiana Transit

I encourage you to consider issues with coordination with Region (Northwest Indiana) mass-transit systems and highways. Coordinating to connect with region bus authority buses and building sufficient, safe parking at the 130th St terminal will encourage commuters and tourists to use the CTA rather than congesting the expressways and downtown streets by driving to work and entertainment venues. The Red Line serves Soldier Field, Wrigley, and US Cellular Field – if people on the south side and northwest Indiana could safely and conveniently park their car where space is abundant and ride in, it would improve the downtown experience for residents and tourists alike.

Thank You for your consideration,
Chris Retson

Subject: Redline Extension

8/03/2011

I'm having some serious problems with this Redline Extension, this project has been in the works for 20+ years and I know that most of the community that the new station will go through are a ruff area. Does it really take that long? Does that area not have any TIF funds available? When the community cried out about closing the Greenline "Homan" stop you all took it away anyway. The community in and around the new Morgan St. station said that they wanted a station built because their is no bus service or rail stations in that area, or you have to walk blocks to get to where you want to go in that area. The Blacks have been asking for this extension for years. Now you need another 2 years to do another survey. Their was never any public hearings on the Morgan St. station or if it was it was so little known about it. You all had pretty signs the other night, but what was it all for? You had CDOT money for that project, but no money for the extension project, I'm just not getting it. The you all are buying camera's to put in every station, but the thugs have taken over 95th, 87th, 79th, 69th, and 63rd street stations. Police @ 95th spend most of their days in that corner office or talking to CTA employee's. Do I feel safe at any of these station, "No I don't". Why do Police officer come to the customer service desk, ask the clerk to sign a form and then leave? What are you paying these guys to do? you seem to have money to buy all of this equipment but no one is manning them. how is it that people can come and shit on the platform piss on the platform and never and do mean never get caught, that's crazy. the police never ride past the 35th Sox stop going South. you all need to monitor your employee's more. whatever happen to the secret travel program, after you all got a ton of how your employee's really work the program kind of disappeared. I ride CTA because I like how I can get from one part of the city to another with less hassle, but I never ever speak or ask a CTA employee anything because they are so rude to a person just asking for directions. When it comes time for you all to ask Springfield for money, I sit at my desk at work and call and tell them to not give you all a dime, the employee's are just to rude. The bus driver's are again about to start letting the school kids get on the bus without using that have fare card...it happens every year. you need a system that monitor's your employee's. The supervisor's are to buddie, buddie with their co-workers do that system is really broke. come stand at 95th with me and I can spot all the problem and just show them to you

Fact Sheets

YOUR RED

Red Line Extension

Draft Environmental Impact Statement Issues

The Draft Environmental Impact Statement (EIS) will analyze potential impacts to environmental, social, and economic resources of the area surrounding each Red Line Extension alternative. Some of the effects would be beneficial such as increased transit access, reduced travel time, and reliability or reduced congestion on area streets. While only very preliminary evaluations of the project area have been conducted to-date, it is likely that there would not be substantial impacts to natural resources such as wildlife, wetlands, air quality, or water quality. The resources in the project area that could experience impacts will be identified in the Draft EIS along with potential mitigation measures.

During scoping in 2009, the community expressed concerns about potential impacts related to traffic, property acquisitions, community and neighborhood compatibility, visual and aesthetic effects, and noise and vibration. This handout provides a preliminary summary of some of these potential effects, focusing mainly on the Locally Preferred Alternative – Union Pacific Railroad (UPPRR) Alternative.

Traffic – The proposed line would be elevated and would not have at-grade crossings that could increase traffic congestion. All alternatives would include new park and ride facilities at each station and there could be traffic effects in the vicinity of the stations that would be evaluated in the Draft EIS. Mitigation measures would be developed to help offset potential impacts. Overall, the effect of the extension would be expected to be beneficial as more people would be able to access transit and reduce the number of cars on the roads.

Community and Neighborhood Compatibility – None of the alternatives would divide neighborhoods with new transit structures, but the project could change the character of some blocks. Through community involvement and context sensitive design, mitigation measures would be developed to address this potential impact in a way that would be acceptable to the community.

Visual/Aesthetics – All of the build alternatives envision an elevated line that would be constructed adjacent to freight lines, businesses, and residences. Some neighborhoods are oriented so that the new transit line would face the fronts of homes while in other neighborhoods the new tracks would face the sides or backs of homes. How this orientation affects the visual conditions of each neighborhood will be studied in the Draft EIS.

Property Acquisition – Ideally CTA would like to operate in UPRR right-of-way so that there are no / minimal property impacts and will work with UPRR to negate / minimize property impacts. CTA is also evaluating two options for the Union Pacific Railroad (UPRR) Heavy Rail Transit Alternative - the East Side Option and the West Side Option, if UPRR right-of-way is not available. The amount of acquisition will depend on UPRR expansion plans and clearance requirements. If acquisition is required, the effects could range from a narrow easement along the edge of a property to a full acquisition and property owners would be compensated in compliance with federal laws.

Historic Resources – Several structures within the project area are older than 50 years and could potentially be considered historic. The Draft EIS will conduct a survey of such structures and determine the eligibility of each for listing on the National Register of Historic Places.

Noise and Vibration - Construction involves the use of heavy equipment which can create noise, work zones that can have visual impacts, traffic detours, and activities that generate dust which can all affect neighboring properties. Operation of a rail transit system can generate noise and vibration. Mitigation measures would be developed to reduce these potential impacts.

Parks – The East Side Option of the UPPR alternative could directly affect portions of Wendell Smith and Block Parks, while the West Side Option could affect portions of the Fernwood Parkway. If these impacts were allowed, mitigation would be required.

UPRR Alignment Options Comparison

	West Side Option	East Side Option
Length of extension	5.3 miles	
New stations	4 new stations near 103rd, 111th, 115th, and 130th Streets	
New park-and-ride facilities	4 new park-and-ride facilities with total 1,500 parking spaces	
Expected travel time savings from 130th Terminal to Loop, compared to No Build Alternative	20.50 Minutes	
Increased mobility	Fewer transfers	
Potentially affected parks	Fernwood Parkway	Wendell Smith Park Block Park
Potentially affected properties	Ideally CTA would like to operate in UPRR right-of-way so that there are no / minimal property impacts and will work with UPRR to negate / minimize property impacts.	

YOUR RED

Red Line Extension

Transit Projects and Your Property

Ideally CTA would like to operate the Red Line Extension in Union Pacific Rail Road (UPRR) right-of-way so that there are no / minimal property impacts and will work with UPRR to negate / minimize property impacts. As part of the federal environmental review process, CTA has to evaluate different alternatives for potential impacts and mitigation measures.

How does CTA acquire private property for a project?

Government programs designed to benefit the public as a whole can result in acquisition of private property and, sometimes, in the displacement of people from their residences or businesses. State and federal constitutions recognize the need for public agencies to purchase private property for public use. Congress passed the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (The Uniform Act), and amended it in 1987. The Uniform Act, along with state and federal constitutions, authorize this purchase and assure full protection of the rights of each property owner. As a public agency, CTA can purchase private property for public use, such as for a transit project.

How is property appraised and acquired?

CTA must appraise and purchase properties needed for a transit project in accordance with federal rules. If CTA is interested in acquiring your property, or a portion of it for a transit project, you, the property owner, will be notified as soon as possible. Shortly thereafter, an independent appraiser will contact you to make an appointment to inspect your property. The appraiser is responsible for determining the initial fair market value of the property. You, or a representative that you designate, will be invited to accompany the appraiser when the appraiser inspects your property. You or your representative may provide information about improvements to the property and any special features that may affect the value of the property to CTA's appraiser to ensure that these facts are considered in the appraisal. After the appraisal and a review appraisal is completed (and approval of CTA's funding agencies is obtained, if required), CTA will present a written offer for the property based upon the appraised value of the property. CTA is legally required to offer to purchase your property for an amount that is not less than the appraised value of the property.

Does CTA assist with relocation for those displaced by the property acquisition?

CTA will provide financial assistance and relocation services, as required by federal rules, for property owners and for commercial and residential occupants who must move because of a transit project. Both owners and occupants are contacted promptly by CTA and/or its relocation consultant after CTA has presented an offer to the property owner to acquire the property. The relocation procedure as well as eligibility for relocation payments and advisory services to be provided by CTA and/or its relocation consultant is explained.

Will the Red Line Extension project require any residential or business relocation?

The land acquisition, displacements, and relocations sections of the Environmental Impact Statement (EIS) will present a summary of the potential impacts related to residential and non-residential relocations. The Draft EIS, when complete will be available for public review.

For More Information

Welcome to Red Line Extension Open House!

95th
834
2941

This open house is to keep you informed about the proposed Red Line Extension.

Tonight we have an interactive open house format in lieu of a formal presentation.

If you have questions, feel free to ask the representatives stationed around the boards.

CTA continues to make progress on the proposed Red Line Extension project.

Red Line Extension

cta

Red Line Extension — What's New

- Red Line Extension is now part of the ***YOUR RED*** Program to extend and enhance the entire Red Line
- CTA pursued and received $8.4 Million in federal funding for preparing Environmental Impact Statements (EIS) for ***YOUR RED*** projects
- Red Line Extension is identified as a Priority Project in the Chicago Metropolitan Agency for Planning's GO TO 2040 Regional Transportation Plan
- EIS Scoping completed
- Next Step – Prepare Draft EIS

Red Line Extension

Project Purpose

- Enhance economic competitiveness and neighborhood livability through access and mobility improvements
- Reduce travel times to jobs and community destinations for Far South Side and South Suburban residents
- Increase transportation choices
- Improve transit performance
- Support community revitalization initiatives

Why Extend the Red Line?

- Reliable and timely access to employment centers and community destinations is not readily available on the Far South Side
- 95th Street Terminal has poor passenger access with no Park & Ride
- Riders experience delays at the 95th Street Terminal due to crowded nearby intersections and insufficient space for bus transfers
- Crowded conditions at 95th Street Terminal for buses and riders may result in safety issues
- Road congestion in the Far South Side limits mobility
- Area population is highly transit-dependent

cta

Environmental Review Process

The Federal Transit Administration and CTA have initiated the federal environmental review process and are preparing an Environmental Impact Statement (EIS).

The EIS will describe:

- Alternatives
  - No Action
  - Transportation System Management (Bus Rapid Transit)
  - Halsted Street
  - Union Pacific Railroad - the Locally Preferred Alternative
- Existing environmental setting
- Potential impacts from construction and operation of each alternative
- Proposed mitigation measures to minimize potential impacts

This process will help refine the locally preferred alternative.

Issues Potentially Evaluated in Environmental Impact Statement (EIS)

- Historical and Cultural Resources
- Natural Resources such as Air Quality, Water Quality, Wildlife, Wetlands, and Endangered Species
- Land Use including Neighborhood Compatibility, Land Acquisition, Displacement, and Relocation
- Parklands and Recreational Facilities
- Safety and Security
- Transportation including Traffic, Parking, and Transit Access
- Visual and Aesthetic Impacts
- Noise and Vibration
- Energy Use
- Zoning and Economic Development
- Cumulative Impacts such as from Secondary Development
- Construction Impacts

Other issues may be added for evaluation as needed.

EIS Scoping Comments Received

Scoping comments will be addressed in the Draft EIS.

	Number of comments received		
Purpose and Need	7	Ease congestion in the region Improve transit access to and from Far South side Reduce congestion at 95th and Dan Ryan terminal Provide connections to transit disadvantaged communities	
Proposed Alternatives	326	Locally Preferred Alternative – UPRR HRT Alternative *317 comments supported the alternative; 1 comment opposed the alternative* Halsted Street Alternative *3 comments supported the alternative* Other Alternatives *8 comments*	
Station Locations and Connections	338	Connectivity to Altgeld Gardens at 130th Street Bike access and parking facilities Parking facilities – size and location Bus Transfer Facilities	
Design Features	12	Operator facilities Passenger information Green roofs Signal priority for bus access	Recycling Alternative energy Natural storm water management Native landscaping
Potential Impacts	384	Transportation Impacts Land Acquisitions, Displacement and Relocations Community and Neighborhood Impacts Visual and Aesthetic Impacts Noise and Vibration	Parklands Economic and Fiscal Impacts Safety and Security Environmental Justice Construction Impacts Public Services

Note: *Tallies are approximate. Combined numbers of comments listed in the subsections will be greater than the total number of comment submissions because some people discussed multiple topics in their submission.*

Agency Coordination and Public Involvement

August 2013 Newsletter

RED AHEAD

Red Line Extension

CTA wants to keep you informed about our proposed Red Line Extension (RLE) Project, part of the Red Ahead Program, a comprehensive initiative for maintaining, modernizing, and expanding Chicago's most-traveled rail line.

Summer 2013 Newsletter

RLE Project:

The CTA is proposing to make transportation improvements by extending the Red Line from the 95th Street Terminal to the vicinity of 130th Street. The proposed 5.3-mile extension would include four new stations near 103rd, 111th, Michigan, and 130th Streets.

RLE Project Status:

Since the RLE Project open house meeting during the summer of 2011, we have started the technical analysis of the project and are preparing a Draft Environment Impact Statement (EIS) on behalf of Federal Transit Administration (FTA), which is the federal lead agency for the project.

What is an Environmental Impact Statement?

RLE Project will require significant federal funding for construction. To acquire federal funding, an EIS is required by the National Environmental Policy Act (NEPA). An EIS includes a description and comparison of each of the studied alternatives, explanation of the existing environmental setting and community context, and analysis of potential positive and negative effects of construction and operation of each alternative.

What's Next for RLE?

The CTA is continuing to coordinate with communities and will be hosting an open house and attending community group meetings throughout the winter to share preliminary findings of the environmental studies and learn about the communities' desires and concerns. After that outreach, we will make sure the proposed project responds to community concerns, and then issue the Draft EIS in conjunction with the FTA. A public hearing will be held on the Draft EIS in 2014.

Red Line South Reconstruction Project:

The CTA is rebuilding the tracks along the Red Line's Dan Ryan Branch from Cermak-Chinatown to 95th/Dan Ryan—a project that will provide faster, smoother and more reliable service for Red Line South riders. Crews are replacing everything in the track bed, including ties, rail, third rail, ballast and drainage systems. Red Line South stations are receiving improvements ranging from new canopies, paint, and lighting upgrades to new benches and bike racks, plus accessibility upgrades (including new elevators) that will make the entire 10.2-mile route fully accessible. The project is on time and the Red Line South is expected to reopen in October.

The work is part of Mayor Rahm Emanuel's Building a New Chicago program, updating infrastructure critical to the city. Funding for the work is part of more than $1 billion in federal, state and local funding announced in late 2011 by Governor Pat Quinn and Mayor Emanuel for the Red and Purple lines. For more information, visit **redlinesouth.com**.

Executive Summary

Connecting 95th Street Terminal to 130th Street

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed 5.3-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

Open House Meeting

CTA conducted an open house meeting on May 13, 2014 to update the public on the status of the Red Line Extension Project; inform them of proposed alternatives, anticipated project benefits and impacts; and gather feedback from the residents of the Far South Side of Chicago. The meeting was designed to give the public a chance to share their concerns about the project with CTA representatives, as well as learn about the preliminary impact analysis of alternatives and the ongoing Draft Environmental Impact Statement process.

The open house meeting was held in the project area at a location that was accessible by public transportation and ADA compliant. In order to provide the greatest opportunity for community participation, the public meetings were scheduled in the early evening on a weekday. Spanish and sign language interpreters were available during the open house meeting. Outreach was conducted in both English and Spanish languages, as recommended in the limited English proficiency analysis performed during scoping in 2009.

During the meeting, residents had the opportunity to review boards displaying information about the proposed alternatives, talk with CTA representatives about the project, and provide comments.

Inviting the Public

In order to hear from as many members of the community as possible at the public meeting, CTA:

- Sent invitation emails to 670 residents who had previously demonstrated an interest in Red Line projects.
- Updated the Red Line Extension Project webpage, www.transitchicago.com/redeis, with information about the meeting.
- Contacted aldermen and local libraries and provided them with flyers about the open house meeting to distribute to community members.

- Posted alert cards providing information about the open house meeting at the 95th Street Terminal, on Red Line trains, and in buses operating out of the 103rd Street bus garage.

What We Heard

Attendees had the opportunity to comment in writing during the open house meeting. They also could submit their comments after the open house meeting via email or mail. A total of 212 community members attended the meeting. A total of 97 written comments were received from community members as of the date of this outreach summary.

Community members were asked what specific comments or concerns they had about Red Line Extension alternatives, potential impacts, and mitigation measures. Overall, the community supports the RLE Project and noted concerns related to the following topics:

- Property Displacements
- Community and Economic Development
- Noise and Vibration
- Timeline
- Safety and Security
- Traffic
- Alternatives Analysis
- Alternative Preference

As part of the comment card, residents also were asked about their use of Wendell Smith Park, Fernwood Parkway, and Block Park. Of the 81 completed comment cards, 63 filled out the section on the use of local parks. Most commenters responded that they did not use any of the parks. Of the comments received, Wendell Smith Park is the most-used park, primarily for walking, jogging, and community events.

Section 1
Project Background

The Chicago Transit Authority (CTA) conducted an open house meeting on May 13, 2014 to inform the public about the preliminary environmental impact analysis of the alternatives and options being studied for the Red Line Extension (RLE) Project. CTA is proposing to add major new transit service on Chicago's South Side by extending its busiest rail line, the Red Line, south from the 95th Street Terminal to the vicinity of 130th Street. The proposed 5.5-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street as well as bus and parking facilities. The public outreach conducted in April and May 2014, along with the open house meeting, provided an opportunity for community members to learn more about the project, give their input about which alternative and option would best meet their transit needs, and the environmental impacts of each of the alternatives and options.

Section 2
Public Notification Activities

2.1 Press Release

The Mayor's Press Office and CTA Media Relations issued a press release announcing open house meetings for both the RLE and Red and Purple Modernization projects. The press release was posted to CTA's website on April 17, 2014 and is included in Appendix A.

2.2 Elected Officials and Stakeholders

CTA contacted elected officials and stakeholders starting April 10, 2014 to brief them on the project and provide information about the open house meeting. CTA representatives met with elected officials as summarized in Table 1.

Table 1: Elected Officials Briefed

Name	Representing	Briefing Date
Alderman Carrie Austin	34th Ward	April 10, 2014
Alderman Anthony Beale	9th Ward	April 15, 2014
Alderman Roderick Sawyer's Office Alderwoman Michelle Harris's Office Alderman Anthony Beale's Office Alderman Howard Brookins	6th Ward 8th Ward 9th Ward 21st Ward	April 17, 2014
State Representative Al Riley's office	38th District	April 17, 2014
Alderman Carrie Austin's Town Hall Meeting	34th Ward	June 19, 2014

Meeting notes from the April 17th Aldermanic Briefing are included in Appendix B.

CTA provided flyers with information about the open house meeting to elected officials and other stakeholders to distribute to community members. The flyer, available in both English and Spanish, is included in Appendix A. The flyers were also emailed to libraries surrounding the project area to be distributed to patrons. A list of libraries receiving notices is included in Table 2.

Table 2: Libraries Receiving Flyers

Library	Address	City, State Zip
Blue Island Public Library	2433 York Street	Blue Island, IL 60406
Brainerd Branch Public Library	1350 West 89th Street	Chicago, IL 60620

Walker Branch Public Library	11071 South Hoyne Avenue	Chicago, IL 60643
West Pullman Library Branch	830 West 119th Street	Chicago, IL 60628

2.3 Project Website

CTA updated the project website for the Red Line Extension Project, www.transitchicago.com/redeis, on April 17, 2014 with up-to-date project information. The webpage provided general information about the project and alternatives, details about the open house meeting, information about project funding and timeline, and frequently asked questions. A printout of the project webpage is included in Appendix A.

2.4 Social Media Updates

CTA shared three Twitter tweets and three Facebook posts regarding the project on April 17 and 18, 2014. Copies of these social media updates are included in Appendix A.

2.5 Postcards

CTA mailed postcards inviting community members to the public open house on April, 17, 2014, to a list of 3,456 addresses that included public agencies, business groups, churches, schools, and community/neighborhood groups/associations within or near the project area, as well as attendees of previous RLE Project open house meetings and/or those that requested information about future Red Line projects. The postcard provided details about the open house meeting, including the closest transit access, and contact information to request assistance at the meeting. The postcard is included in Appendix A.

2.6 E-blasts

CTA sent an invitation email (e-Blast) with information about the open house meeting and links to the project website on April 17, 2014. A second email reminding recipients of the open house meeting was sent on May 12, 2014. The e-Blasts were sent to 666 and 670, respectively, email addresses of residents who had previously demonstrated an interest in the RLE Project and/or requested information about future Red Line projects. The two e-Blasts are included in Appendix A.

2.7 Transit Alert Cards

A transit alert card providing information about the open house meeting was printed on April 30, 2014 and provided to the following locations:

- 20 alerts were produced for posting at the Red Line 95th Street Terminal station
- 370 alerts were produced for posting on all Red Line rail cars
- 350 alerts were produced for posting on all buses operating out of the 103rd Street bus garage

In total, 740 open house alerts were produced and distributed. The transit alert card is included in Appendix A.

2.8 Media

In response to the CTA announcement, a number of news articles about the RLE Project appeared in local media. Table 3 summarizes the articles that appeared in April and May 2014. The full articles are included in Appendix A.

Table 3: Published Media Articles April and May 2014

Section 3
Participating Agencies

CTA provided an update on the project to the RLE Project participating agencies to inform them of the project status and invite them to the Open House. Participating agencies are federal, state, and local agencies with an interest in the project because of an overlap in their area of jurisdiction or some specialized knowledge of potential project effects. The list of participating agencies and copies of the letters sent to both federal and state, regional, or local participating agencies is included in Appendix C. Responses were received from the Regional Transportation Authority, Chicago Park District, Illinois Department of Transportation, Transportation Security Administration, and Illinois Environmental Protection Agency. Responses are also included in Appendix C.

Section 4
Community Group Meetings

CTA met with local community groups to share information about the project and allow community members to ask questions. Appendix D contains the meeting presentation (the same presentation was given at each meeting), sign-in sheets, and meeting summaries. The meetings are summarized in Table 4.

Table 4: Community Group Meetings

Group Name	Meeting Date
Developing Communities Project (Leadership)	April 16, 2014
Chicago Neighborhood Initiatives Greater Roseland Chamber of Commerce	April 29, 2014
Developing Communities Project (Membership)	April 30, 2014
People for Community Recovery Golden Gate Homeowners Association	May 6, 2014
Rosemoor Community Association	May 7, 2014
Friends of the Parks Chicago Park District	May 8, 2014
Roseland Manor	May 13, 2014
Far South Side Community Development Corporation	May 14, 2014
Agape Community Center	May 15, 2014
34th Ward Town Hall	June 19, 2014

In addition to the groups with which CTA met, CTA also reached out to St. Anthony of Padua Parish and the Roseland Business Development Council in April 2014, but did not meet with either organization.

Section 5
Open House Meeting

CTA conducted an open house meeting to inform the public about the project and to provide people with an opportunity to ask questions about the RLE Project in an informal setting.

Time:	5:30 to 7:30 p.m.
Date:	Tuesday, May 13, 2014
Location:	Palmer Park Gymnasium 201 E. 111th Street Chicago, IL 60628

The meeting was held in a community center familiar to area residents, accessible by public transportation, and was ADA compliant. For the convenience of all attendees, bus lines to and from the meeting site were publicized on the flyer, notice, e-Blast, and on the website. In order to provide the greatest opportunity for community participation, the open house was scheduled in the early evening on a weekday. Spanish translation and a sign language interpreter were made available during the open house meeting.

A total of 212 people signed in at the May 13, 2014 open house. Although everyone was encouraged to sign in, there were a few additional attendees who declined to sign in. Copies of the sign in sheets are included as Appendix E.

During the open house meeting, project team members explained information presented on exhibit boards and answered project-related questions. Attendees also had the opportunity to view a video prepared by the Chicago Metropolitan Agency for Planning (CMAP) about the RLE Project. The video was played continuously during the open house, and is available online at: cmap.illinois.gov/mobility/transit/red-line. The open house provided attendees an opportunity to review the project information and give feedback about which project alternative would best meet their transit needs and the potential environmental impacts.

Photos from the meeting are included in Appendix F.

5.1 Meeting Materials

Meeting attendees were offered comment cards, a project factsheet with information on the project (available in both English and Spanish), and a glossary of terms to be consulted as they visited the project exhibit boards. The comment card allowed attendees to submit written comments during or after the open house meeting. Two specific questions were posed on the comment card:

- What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

- How do you use the following parks? (Accompanied by a table listing Wendell Smith Park, Fernwood Park, and Block Park and activities options such as “Playground,” “Community Events,” and “Other.”)

The comment card, English and Spanish project factsheet, and glossary are included in Appendix G.

CTA developed exhibit boards about the project, which were used during the open house meetings. The boards included:

- Welcome
- Red Ahead Program
- What is the RLE Project?
- Why are we preparing an Environmental Impact Statement (EIS)?
- Project Alternatives: UPRR Rail Alternative
- Project Alternatives: Halsted Rail Alternative
- Project Alternatives: BRT Alternative
- Potential Impacts to Parks
- Potential Property Displacements
- Potential Noise Impacts
- Potential Visual and Community Impacts
- Potential Effects to Historic Properties
- Impacts to Wetlands
- Temporary Construction Impacts
- RLE Project Benefits
- Project Development Process
- Stay Involved

The exhibit boards illustrated the RLE Project alternatives, potential impacts, and potential mitigation measures. Project team members provided meeting attendees with specific information related to these topics and answered questions at each exhibit board. At the "Potential Property Displacements" exhibit board, TA real estate acquisition brochures were available for distribution. Copies of the exhibit boards are in Appendix H.

5.2 Comments Received

Attendees could comment in writing during the open house or submit their comments after the open house via email or mail. Email comments could be sent to a project specific email address (RedExtension@transitchicago.com) found on the comment cards, project website, and on all notification materials. At the May 13, 2014 open house meeting, 76 people filled out and submitted comment cards. In addition, one letter, six comment cards, and fourteen emails were received following the May 13 open house meeting. All comment cards and emailed comments received as of the date of this meeting summary are included in Appendix I.

Community members were asked what specific comments or concerns they had about Red Line Extension alternatives, potential impacts, and mitigation measures. Overall, the community supports the RLE Project. They noted the following concerns and comments:

- Property Displacements: Commenters wanted to know how many properties would be purchased, what properties would be purchased, how owners would be compensated, and how the RLE Project would impact property values. Commenters also expressed concern regarding the potential emotional impacts of property acquisitions on long-time area residents, particularly senior citizens.

- Community and Economic Development: Commenters stated that communities in the project area are underserved by public transit and have been waiting for this project. Commenters would like to see the RLE project create jobs for area residents and increase economic development. Some commenters expressed concern that the RLE Project would disrupt the residential communities along the project alternative alignments.

- Noise and Vibration: Commenters requested additional information regarding train noise and if its vibration would affect home foundations.

- Timeline: Commenters requested additional information regarding the project timeline and length of construction.

- Safety and Security: Commenters suggested that the elevated trains could make the street darker, possibly increase crime, and decrease safety. Commenters also suggested that pedestrian safety be evaluated at stations along the UPRR tracks as well as the 130th Street Station.

- Traffic: Commenters expressed concern about traffic impacts related to the project. One commenter also suggested that the project would reduce congestion on I-94.

- Alternatives Analysis: Several commenters provided suggestions for alternate routes, modes, parking, and/or the RLE terminal station.

- Alternative Preference: Commenters provided preferences for both the UPRR Rail Alternative and Halsted Rail Alternative. The majority of comments that expressed a preference related to the alternatives were in support of the UPRR Rail Alternative although some commenters were in opposition to the UPRR Alternative because of property displacements. Multiple commenters opposed the Halsted Rail Alternative because of visual, noise, historic resources, and safety impacts, and because it wouldn't provide transit access to underserved communities.

The comment cards also asked how attendees use project area parks; attendees could mark multiple activities and multiple parks. Of the 82 completed comment cards, 67 filled out the section on the use of local parks. A summary of responses to the second question is shown in Table 5.

Table 5: Use of Project Area Parks

Park	Baseball / Softball / Basketball	Play ground	Walking / Jogging	Community Events	Other	I do not use this park	No Response
Wendell Smith Park	8	5	14	13	5	47	18
Fernwood Parkway	3	5	7	7	7	40	27
Block Park	1	1	7	3	3	47	26

Mayor Emanuel, CTA Announce Next Steps in Modernizing the Red Line, CTA’s busiest rail line

4/17/2014

CTA Unveils First Phase of its Red and Purple Modernization Program That Will Ultimately Rebuild the Northern Section of the Red Line and the Parallel Purple Line

Red Line Extension Plan to Extend the Red Line South of 95th Street to 130th Street Moves Forward with its Environmental Process

Mayor Rahm Emanuel and CTA President Forrest Claypool today announced the first phase of its Red and Purple Modernization (RPM) program, which will completely rebuild the northern section of the Red Line and the parallel Purple Line, and beginning of the next step in a federal process to secure funding for the Red Line Extension plan, which would extend the Red Line south from 95th Street to 130th Street.

These are the latest steps in the ongoing modernization of the CTA under Mayor Emanuel.

“As a world-class city, Chicago has a world-class transit service to connect residents to jobs, education, culture and above all opportunity,” said Mayor Emanuel. “CTA is investing in modernizing the Red Line as part of our strategy to create a seamless, safe, and reliable transportation system for every neighborhood.”

The CTA’s Red Line, which runs 24/7 along 23 miles of tracks, is Chicago’s busiest rail line with about 75 million annual rides.

The Red and Purple Modernization program and the Red Line Extension project are the latest in a series of Red Line projects to modernize and extend the backbone of the CTA’s rail system that have been undertaken since 2011.

With a significant portion of the Red Line built more than a century ago, the improvements would address the current need to expand capacity by building new infrastructure to accommodate growing ridership. Additional Red Line modernization projects under Mayor Emanuel include:

- Successful $425 million replacement of the Red Line South railroad in 2013, as well as station rehabilitations.

- $86 million renewal and rehabilitation of seven far north side stations in 2012.
- $240 million new 95th Street Terminal, work beginning in late summer.
- $203 million Wilson station reconstruction and track and signal replacement, major construction to begin this fall.

“These projects are the next steps in our overall vision to rebuild, modernize and expand the entire Red Line,” said P President Claypool. “We’re already kicking off Red and Purple Modernization by beginning reconstruction of the Wilson station this fall and continuing progress on the South Side by starting the new 95th Street Terminal this summer, following the successful completion of the Red Line South reconstruction last year. With both the Red and Purple Modernization and Red Line Extension projects, we’ll replace outdated infrastructure with a modern, efficient rail, and build more than five miles of new track. Together these improvements will offer CTA customers faster, more reliable service, and increasing access to quality rail transportation for thousands of future riders.”

The CTA is also moving forward with its proposed Red Line Extension plan by beginning the second step of its environmental process to ultimately finish the Environmental Impact Study, which is required to begin engineering on the plan to extend the Red Line south of 95th Street to 130th Street. Both projects will include a broad community outreach process that will begin next month to solicit community feedback on both projects and provide updates on the funding process for each project.

About Red and Purple Modernization

The RPM program will proceed in phases to fully replace old, deteriorating infrastructure and stations along the entire north branch of the Red Line and the parallel Purple Line, and will pave the way for CTA to significantly increase train capacity for the next 80 years.

This section of the Red and Purple lines carries one out of every five CTA rail rides and serves customers in some of the densest, most diverse neighborhoods in Chicago. Rush-hour ridership has jumped 40 percent in the last five years alone.

Most tracks and bridges along the Red and Purple lines are nearly 100 years old. Despite rising demand, the CTA is unable to increase capacity because of the current infrastructure’s age and structural limitations. Continuing to operate a busy rail line on this outdated infrastructure results in high maintenance costs, the need for frequent repairs that disrupt service and slow travel, as well as outdated stations that can’t accommodate elevators or other necessary and modern amenities.

RPM will create a completely rebuilt rail line, resulting in faster, smoother rides, modern, fully ADA accessible stations along the entire corridor and more frequent train service to alleviate overcrowding.

The first phase of the RPM improvements will include two main components:

- **Station and track modernization, Wilson to Bryn Mawr:** Completely rebuilding the Wilson, Lawrence, Argyle, Berwyn, and Bryn Mawr stations and rebuilding all tracks, support structures, bridges and viaducts for the Red and Purple lines between Lawrence and Bryn Mawr. Replacement of the Wilson station and surrounding infrastructure begins this fall. These

Google Maps ➔ RTA Trip Plan

About trip planners (and more opti

stations were built originally between 1908 and 1923 and the elevated support structures date back to the 1920s. The Bryn Mawr station was last updated 40 years ago, in 1974; the remaining three stations received interim station renewal work in 2012. Reconstruction of these stations will include adding elevators at each to make them accessible to customers with disabilities. The project also includes rebuilding the tracks, signals and support structures, which will significantly improve train speeds and service reliability on the slow zone-plagued stretch. (The Wilson station project is already funded from state, federal and local sources, and is currently proceeding through a separate Environmental Assessment process.)

- **Construction of a Red-Purple bypass.** Construction of a bypass north of the Belmont station to eliminate delays and speed up train service where the Red, Purple and Brown lines currently all intersect. The current configuration requires trains on three of four tracks to stop and wait for Brown Line trains to cross, which results in more than 40 percent of weekday trains being delayed by as much as three minutes. About 150,000 rides travel through this intersection each weekday, all of which are slowed down because trains must stop and wait for signal clearance. The structure’s original 1907 design makes it difficult, under present day and service demands, to provide reliable service and makes adding service extremely challenging.

“Modernizing Red Line rail service and stations strengthens our neighborhoods by making transit more reliable and ultimately generating new economic development near revitalized stations,” said Ald. Harry Osterman. “We’re pleased that Mayor Emanuel and the CTA recognize the importance of safe, reliable transit in neighborhoods near the Red Line, including Andersonville, Edgewater and Uptown, and look forward to working closely with the CTA on this exciting program.”

Future phases of RPM will bring the same level of infrastructure and station improvements to the remaining sections of the Red and Purple lines, from north of Belmont station to Linden station in Wilmette.

Estimated cost for the first phase of RPM is $1.7 billion.

In November 2013, the CTA became the first transit system accepted into the Federal Transit Administration’s (FTA) new Core Capacity Program that provides funding to transit systems to add capacity on existing infrastructure for future ridership growth. The RPM project is eligible for 2014 Core Capacity federal funding approved by Congress earlier this year.

About RLE

The 5.3-mile Red Line Extension project will extend south from the 95th Street Terminal through the greater Roseland community. Plans include construction of four new stations near 103rd Street, 111th Street, Michigan Avenue/116th Street and 130th Street, all with bus and parking facilities.

The RLE project will provide rapid transit rail access to a low income, transit-dependent Far South Side area that does not have direct CTA rail service. An extended Red Line will provide up to a 20-minute time savings to downtown by providing one-seat service, as opposed to the current bus-rail trip from 130th Street. It will also improve access to jobs and education, and foster economic development.

In 2011, the CTA received funding from the FTA to conduct the Environmental Impact Statement (EIS) for the RLE project—a major, important step in the multi-step federal process to secure approval and funding of the $2.3 billion dollar project.

Public Input and Next Steps

The CTA will meet with community groups and host public open houses to share details and seek input on the proposed RPM and RLE projects. Members of the public can submit formal comments directly to the CTA or at public open houses where CTA and representatives will provide additional information on RPM and RLE project plans. For each project, CTA is seeking community input on the location, design, and social, economic, and environmental effects of the proposed improvements.

The **Lawrence to Bryn Mawr Modernization Open House** will be held Wednesday, May 21, at Truman Community College, 1145 W. Wilson Ave. from 5:30 p.m. to 7:30 p.m.

The **Red-Purple Bypass Open House** will be held Thursday, May 22, at the 19th District Police Station, 850 W. Addison St., from 5:30 p.m. to 7:30 p.m.

The **RLE Open House** will be held Tuesday, May 13, at Palmer Park Gymnasium, 201 E. 111th St., between 5:30 p.m. and 7:30 p.m.

Comments for either project can also be submitted by email or postal mail to:

RPM@transitchicago.com

RedExtension@transitchicago.com

Chicago Transit Authority
Strategic Planning, 10th floor
Attn: RPM Project or RLE Project
567 W. Lake Street
Chicago, IL. 60661-1465

Following public input, the CTA will deliver draft environmental studies for both RPM Phase One and RLE to the FTA as part of the process to request federal funding. Timing for construction starts on each project is dependent upon the receipt of funding for each project. By the beginning of May, the CTA will release a request for Letters of Interest and Qualifications (LIQ) for Preliminary Engineering (PE) services for Phase One of RPM.

For more information about the Red Purple Modernization and Red Line Extension projects, visit transitchicago.com.

RED AHEAD
Moving Ahead to a Better Red

Red Line Extension

You're invited to attend a CTA open house on the

Red Line Extension Project

When and Where?

Tuesday, May 13, 2014
5:30 to 7:30 p.m.

Palmer Park Gymnasium
201 E. 111th Street
Chicago, IL 60628

This location is served by:
CTA Bus #34, #111, #119; Pace Bus #353;
and Metra Electric 111th Street (Pullman).

This facility is accessible to people with disabilities.

At the open house, you will learn more about the proposed alternatives, hear about anticipated project benefits and impacts, and have the opportunity to provide feedback.

What's New with the Red Line Extension Project?

Since the RLE Project open house meeting during the summer of 2011, we have been preparing a Draft Environmental Impact Statement (EIS) based on the technical analysis of impacts of the alternatives. Findings from this preliminary impact analysis of the alternatives will be discussed at the Open House. CTA welcomes your comments and feedback about the RLE Project alternatives and potential impacts, which will be incorporated into the Draft EIS.

This project is one part of CTA's Red Ahead Program, a comprehensive initiative for maintaining, modernizing, and expanding Chicago's most-traveled rail line.

Do you require assistance?

If you require an interpreter, including sign language services, or other accommodations at this meeting, contact Gerald Nichols, CTA Government and Community Relations, at least five days prior to the meeting at 312-681-2807 or GNichols@transitchicago.com.

Para informacion en Español, llame al 312-681-2807

Customer Information: 1-888-YOUR-CTA (1-888-968-7282)

BUILDING A NEW CHICAGO

cta

RED AHEAD
Moving Ahead to a Better Red

rx **Red Line Extension**

Usted está invitado a una reunión abierta al público sobre el proyecto

Extensión de la Línea Roja

¿Cuándo y Dónde?

Martes, 13 de Mayo del 2014
5:30 p.m. a 7:30 p.m.

Gimnasio de Palmer Park
201 E. 111th Street
Chicago, IL 60628

Este lugar es accesible por: Las rutas de autobus #34, #111, #119; Autobús Pace #353; y Metra Electric 111th Street (Pullman).

Las instalaciones son accesibles para las personas con discapacidad.

Durante la reunión, usted se informará acerca de las alternativas propuestas y los beneficios e impactos anticipados. También tendrá la oportunidad de compartir sus preferencias y sugerencias.

¿Qué hay de nuevo con la Extensión de la Línea Roja?

Desde la última reunión de la Extensión de la Línea Roja en el verano del 2011, CTA ha estado preparando el borrador de la Declaración de Impacto Ambiental, basada en el análisis técnico de los impactos de las alternativas. Las conclusiones de este análisis preliminar de las alternativas será discutido en la reunión. CTA con gusto acepta sus comentarios y sugerencias acerca de las alternativas y los impactos del proyecto de Extensión de la Línea Roja, los cuales serán incorporados en el borrador de la Declaración de Impacto Ambiental.

Este proyecto es una parte del programa *Red Ahead Program* de la CTA, una iniciativa comprensiva para mantener, modernizar y extender la línea de tren más usada en Chicago.

¿Requiere Asistencia?

Si usted necesita un intérprete, incluyendo servicios de lenguaje de señas, u otros servicios especiales durante la reunión, comuníquese con Gerald Nichols, oficial de relaciones gubernamentales y comunitarias para la CTA, al (312) 681-2807 o GNichols@transitchicago.com por lo menos cinco días antes de la reunión.

Llame al 312-681-2807 para información en español

About the Red Line Extension

Connecting 95th Street Station to 130th Street

Overview

The Chicago Transit Authority (CTA) is proposing to make transportation improvements by extending the Red Line from the 95th Street Terminal to the vicinity of 130th Street. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

See a PDF summary of the project

Purpose & Need

The purpose of the Red Line Extension is to:

- Reduce commute times for residents both within and south of the project area.
- Improve mobility and accessibility for low-income and transit-dependent residents in the project area.
- Improve rapid transit rail service to isolated areas and provide viable linkages to affordable housing, jobs, services, and educational opportunities, thereby enhancing livability and neighborhood vitality.
- Improve connections and linkages of public transportation modes in the project area.
- Foster economic development in the project area, where new stations/stops may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.

The RLE Project is needed to respond to the following problems:

- Transit trips to jobs are longer for Far South Side residents compared to the Chicago region as a whole.
- Transit-dependent populations lack direct access to rapid transit rail service.
- The project area is geographically isolated from major activity centers and lacks viable transportation options, which limits access to affordable housing and supporting infrastructure.
- Existing transit markets are underserved and transit connectivity is challenging in the project area.
- Disinvestment and limited economic development in the project area have

negatively impacted Far South Side communities.

Project Alternatives

Several alternatives, which included different routes and technologies, were considered during the Alternatives Analysis process. The alternatives were then narrowed down through public and agency feedback to the four alternatives described here. These alternatives are being analyzed in the Draft Environmental Impact Statement.

No Build Alternative

The No Build Alternative is defined as the existing transportation system plus any committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010-2015 Transportation Improvement Program (TIP). All elements of the No Build Alternative are included in each of the other alternatives.

The No Build Alternative would include the following:

- Existing transportation system
- Committed transportation improvements including bridge reconstructions, 95th Street Terminal Improvement Project, several road improvement projects including resurfacing and coordination of signal timing, work on Metra’s facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities
- Bus transit service focused on the preservation of existing services and projects

Bus Rapid Transit (BRT) Alternative

The proposed Bus Rapid Transit (BRT) Alternative (formerly referred to as the transportation system management alternative) would operate between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue via East 95th Street, Michigan Avenue, East 127th Street, South Indiana Avenue, and East 130th Street. The BRT would operate in mixed traffic and would not include new dedicated bus lanes.

The BRT Alternative would include the following features:

- Transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2010-2015 Transportation Improvement Program as described in the No Build Alternative
- 5.5 mile BRT service from 95th Street Terminal with four stops at 103rd Street, 111th Street, Kensington Avenue, and 130th Street
- New park & ride facilities at all stops
- Traffic signal priority at signalized intersections along 95th Street, Michigan Avenue, and 130th Street

Union Pacific Railroad (UPRR) Rail Alternative – Locally Preferred Alternative

The proposed UPRR Rail Alternative would extend the heavy rail transit line from the existing Red Line 95th Street Terminal to 130th Street. The UPRR Rail Alternative would operate on an elevated structure heading south from 95th Street along the I-57 Expressway for nearly one-half mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of South Prairie Avenue, the alignment would cross over the Canadian National/Metra Electric tracks near 119th Street, where it would transition to an at-grade profile and then continue southeast along the Northern Indiana Commuter Transportation District Chicago South Shore & South Ben Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Indiana Harbor Belt (IHB) alignment to terminate at 130th Street. The UPRR Alternative was selected by the Chicago Transit Board as the Locally Preferred Alternative on August 12, 2009.

The Locally Preferred Alternative would include the following features:

- Transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2010-2015 Transportation Improvement Program as described in the No Build Alternative
- 5.3-mile heavy rail transit line extension from 95th Street Terminal to 130th Street
- Four new stations at 103rd Street, 111th Street, Michigan Avenue, and 130th Street
- New park & ride and bus terminal facilities at each station
- Bus transit service from the south to the new stations for faster travel to downtown Chicago
- New yard and shop at 120th Street

Three alignment options are being studied in the Draft EIS:

- Right-of-Way (ROW) Option
  The ROW Option was identified during the environmental analysis. As part of this option, the UPRR freight trains would relocate to another area (as part of a separate project), and new elevated CTA Red Line tracks would be built in the space where the Union Pacific freight rail tracks are now. This option would be contingent upon the UPRR relocating. The Chicago Department of Transportation (CDOT) has been working with the affected railroads to assess the technical and operational feasibility of such relocation. The results of CDOT's analysis will help to inform the feasibility of this new option.
- East Option
  As part of the East Option, CTA tracks would be placed immediately adjacent to the UPRR right-of-way to the east.
- West Option
  As part of the West Option, CTA tracks would be placed immediately adjacent to the UPRR right-of-way to the west.

Two options for the 130th Street terminal station are being studied in the Draft EIS. The South Station Option would be located to the west of the NICTD/CSS & SBRR right-of-way at 130th Street. The West Station Option would be located along the north side of 130th Street to the west of the NICTD/CSS & SBRR route.

Halsted Rail Alternative

The proposed Halsted Rail Alternative would extend the rail line from the existing 95th Street Terminal to the intersection of Halsted Street and Vermont Avenue near 127th Street.

The Halsted Alternative would operate on an elevated structure between the existing 95th Street Terminal and the intersection of Halsted Street and Vermont Avenue near 127th Street. The alignment would follow the median of the I-57 Expressway until reaching Halsted Street. It would then turn south onto Halsted Street and continue to Vermont Avenue.

The Halsted Alternative would include the following features:

- Transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2010-2015 Transportation Improvement Program as described in the No Build Alternative
- 5-mile heavy rail transit line extension from 95th Street Terminal to the intersection of Halsted Street and Vermont Avenue
- Four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue
- New park & ride facilities at each station
- Bus transit service from the south to the new stations for faster travel to downtown Chicago
- New yard and shop at 119th Street

RED AHEAD Red Line Extension

Environmental Review

Overview

The National Environmental Policy Act (NEPA) requires evaluation of potential environmental impacts associated with federal projects and actions. In accordance with the NEPA, the Chicago Transit Authority (CTA) and the Federal Transit Administration (FTA) are preparing an Environmental Impact Statement (EIS) that will evaluate the environmental effects of constructing and operating the proposed extension.

Environmental Impact Statement

The CTA is currently in the process of preparing a Draft EIS. The Draft EIS will include an evaluation of the No Build Alternative, the BRT Alternative, the UPRR Rail Alternative, and the Halsted Rail Alternative. The Draft EIS will describe the alternatives, the existing environmental setting, the potential impacts from construction and operation of the alternatives, and proposed mitigation measures to reduce or eliminate potential impacts.

The purpose of the EIS is to study, in a public setting, the effects of the proposed project and its alternatives on the quality of the physical, human and natural environment. Areas to be evaluated for potential impacts from construction and operation of the proposed project include, but are not limited to:

- Transportation
- Land use and economic development
- Displacement and relocation of existing uses
- Neighborhood and community
- Visual and aesthetic
- Noise and vibration
- Safety and security
- Historic and cultural resources
- Hazardous materials
- Air quality
- Wetlands
- Water quality
- Floodplains
- Vegetation and wildlife habitat
- Threatened and endangered species
- Geology and soils
- Energy
- Environmental Justice

The evaluation will reveal the extent to which the proposed project will or will not affect these areas. Measures to avoid, minimize, and mitigate potential adverse impacts will also be identified and evaluated.

To keep you informed about the proposed Red Line Extension Project, a newsletter was sent out in Summer 2013 and is available here.

Schedule

The CTA expects to publish the Draft EIS in early 2015 for public review. The public will have an opportunity to comment on the published Draft EIS during

a 45-day public comment period. During the review period, CTA will host public hearings to receive comments on the Draft EIS from the public and agencies. The CTA will then prepare a Final EIS that will include responses to public comments received in Draft EIS, the environmental analysis of the single NEPA Preferred Alternative, and a list of committed final mitigation measures.

The FTA will consider the Final EIS and prepare a Record of Decision (ROD) selecting the preferred alternative including mitigations for adverse impacts. Issuance of the ROD indicates that CTA has satisfied all of the requirements of the NEPA. The issuance of the ROD will allow CTA to move forward with engineering and construction of the project.

The project schedule is dependent on federal reviews and approvals and funding availability.

August 2011 Open House

The CTA hosted an Open House in August 2011 to keep the public informed about the proposed Red Line Extension.

Tuesday, August 2, 2011, 6:00 p.m. to 8:30 p.m.
St. John Missionary Baptist Church
211 E. 115th Street, Chicago, IL 60628

Open House Exhibit Boards – August 2011

Scoping and Scoping Meetings

The process of determining the scope, focus, and content of an EIS is known as “scoping.” Scoping meetings are an opportunity to obtain information from the public and governmental agencies. The scoping process asks agencies and interested parties to provide input on the proposed alternatives, the purpose and need for the project, the proposed topics of evaluation, and potential effects and mitigation measures to be considered.

The official public comment period for scoping concluded on October 27, 2009. The comments received are summarized in the Scoping Report. Input received during scoping is used to refine the project purpose and need and alternatives, and to direct the analysis of environmental impacts. Public input is also used to help planners avoid potential impacts, and to identify potential mitigation measures.

Alternatives Analysis

The purpose of the Alternatives Analysis (AA) Study, which ended in August 2009, was to examine a wide range of potential transportation options. In the AA process, the project's purpose and need were identified, alternatives that meet the purpose and need were developed and evaluated, and comprehensive and ongoing public involvement was initiated. Many different transportation alternatives were identified in the AA process. Based on public comment and an evaluation of those options against criteria that included cost, environmental factors, and feasibility considerations, the number of options was narrowed. There were three screening stages and the results of each screening stage were presented at public meetings. At each stage, there was an opportunity for the public to review and comment on the results. The end result of the AA process was the selection of a Locally Preferred Alternative by the Chicago Transit Board on August 12, 2009.

Screen 1 Analysis

The CTA held public open houses to receive input on preliminary findings from Screen 1 of the Alternatives Analysis Study for the proposed Red Line Extension.

Tuesday, April 10, 2007, 6-8 p.m.
Chicago State University, New Academic Library, 4th Floor Auditorium
9501 S. King Drive, Chicago, IL 60628

Screen 3 Analysis

The CTA invited the public to open houses to present preliminary Screen 3 findings and a recommendation of a locally preferred alternative, which concluded the Alternatives Analysis study for the Red Line Extension.

Wednesday, June 3, 2009, 6-8 p.m.
Olive-Harvey College, Cafeteria
10001 South Woodlawn Avenue, Chicago, IL 60628

Thursday, June 4, 2009, 6-8 p.m.
Woodson Regional Chicago Public Library
9525 South Halsted Street, Chicago, IL 60628

Presentations delivered at the Screen 3 meetings are available at the following links:

Public Meeting Presentation Part 1 – June 2009 (1.4 MB PDF)
Public Meeting Presentation Part 2 – June 2009 (2.9 MB PDF)
Public Meeting Presentation - June 2009 (Text version)

RED AHEAD Red Line Extension

Red Line Extension Project: FAQ

The Chicago Transit Authority (CTA) knows residents and potential Red Line riders have questions about this proposed extension.

Q: How would CTA fund this proposed project?
A: Two types of funding are needed for the proposed extension – capital and operating. Capital funding (construction funding) for the proposed extension is provided partially by the Federal Transit Administration (FTA), through its "New Starts" grant program. This program provides funding for major public transit infrastructure projects throughout the United States through a highly competitive process. CTA is currently in the environmental review phase of that process that will allow the agency to apply for funding. Upon successfully advancing through the FTA's process, a project would be qualified to receive a Full Funding Grant Agreement (FFGA) from the Federal Transit Administration. The FFGA typically covers about half of a project's capital cost. Other non-federal funds will comprise the remainder of capital funding. Once the proposed extension is built and operational, CTA's operating budget would support day-to-day service.

Q: When would the extended Red Line be open for use?
A: No timeline has yet been established. Project schedule is dependent on federal reviews and approvals and funding availability.

Q: When would construction begin on the proposed Red Line Extension?
A: No timeline has yet been established. Project schedule is dependent on federal reviews and approvals and funding availability.

Q: What will be the operating hours for the proposed extension?
A: In the current project planning phase, the operating hours for the proposed extension are assumed to be the same as for the current Red Line, which operates 24 hours every day of the year.

Q: Would CTA need to buy private property because of the location of the proposed extension?
A: Yes, CTA would need to buy private property for each of the build alternatives. The number of properties impacted varies by alternative; between approximately 52 and 259 properties could be impacted. Final property acquisition requirements would be confirmed as project engineering proceeds. Property owners will be paid not less than fair market value for their land and buildings, and may be eligible for compensation equal to the original purchase price of the property. They would also be assisted in relocating their businesses or dwellings, per the Federal Uniform Act on

relocation assistance and property acquisition. When a single alternative or option is chose, CTA will work with the community and property owners (including the UPRR) to minimize property impacts.

Q: Will there be places to park near the new stations?
A: New park & ride lots are proposed at each new station.

Q: How would this proposed extension impact the natural environment and the community?
A: Potential impacts to the environment are being studied in the Draft Environmental Impact Statement (EIS). The Draft EIS will:
• Identify and evaluate measures to avoid, minimize and mitigate adverse impacts.
• Describe the potential environmental effects of the proposed Red Line Extension improvements and the steps that will be taken to alleviate them.
Typically, environmental reviews for proposed transit projects address:

- Transportation
- Land use and economic development
- Displacement and relocation of existing uses
- Neighborhood and community
- Visual and aesthetic
- Noise and vibration
- Safety and security
- Historic and cultural resources
- Hazardous materials
- Air quality
- Wetlands
- Water quality
- Floodplains
- Vegetation and wildlife habitat
- Threatened and endangered species
- Geology and soils
- Energy
- Environmental Justice

Q: How would this proposed extension impact noise in the community?
A: The Draft Environmental Impact Statement (EIS) will evaluate the potential for noise impacts to the surrounding community. If it is determined that there could be noise impacts, then mitigation measures to reduce those impacts would be proposed in the Draft EIS such as welded rail, closed deck structures, and noise barriers. During the public review of the Draft EIS, you will have an opportunity to review and comment on the analysis and the proposed mitigation measures.

Q: What is the economic impact of this proposed extension?
A: The Draft Environmental Impact Statement (EIS) will evaluate the fiscal and economic benefits and potential impacts of the proposed extension. During the public review of the Draft EIS, you will have an opportunity to review and comment on the economic analysis. Numerous transit studies suggest that transit investments result in economic development. CTA estimates between 2,600 and 4,100 jobs would be created during Red Line Extension construction. In addition, new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.

Q: How would the proposed Red Line Extension affect current CTA services, both during construction of the new service and during operation of the new service?
A: The specifics of construction for the proposed Red Line Extension have not been established yet. CTA’s general guidelines minimize the effects of construction on existing transit services. However, bus reroutes are possible. Once the proposed extension is complete, existing bus routes may be changed to complement the new high-capacity transit service. Depending on the specific route of the service, the number of routes feeding into the 95th

Street Terminal may be reduced, which would also reduce congestion in and around this facility.

Q: Is it possible that at some point this proposed Red Line Extension could go even farther to the Gary Airport and South Bend, Indiana?
A: At this point CTA's proposal for the Red Line Extension is limited to the project's defined study area, which is bounded by the Little Calumet River and 134th Street on the South. Any initiative to further expand service to the Gary Airport and South Bend, Indiana, would merit further investigation and its own planning study.

Q: If the CTA already has a Locally Preferred Alternative, why is the Draft Environmental Impact Statement (EIS) still studying two other build alternatives?
A: The federal National Environmental Policy Act (NEPA) process requires that we evaluate a range of alternatives in the EIS along with the Locally Preferred Alternative and a No Build Alternative (which looks at the existing transportation system, plus any committed transportation improvements that already are in the Chicago Metropolitan Agency for Planning Fiscal Year 2010 to 2015 Transportation Improvement Program). Other alternatives to be evaluated in the Draft EIS would include a Bus Rapid Transit Alternative and an elevated transit line along Halsted Street (which would not impact any parkland but could have other impacts). Federal law protects parklands from use by transportation projects unless there are no feasible or prudent alternatives that avoid the use of parklands. Project planning must include all possible planning to minimize harm to parklands and therefore, the Halsted Alternative will be evaluated in further detail in the Draft EIS. Based on the environmental analysis and public feedback received in the Draft EIS, a single NEPA preferred alternative will be selected and proposed in the Final EIS.

Q: For the Locally Preferred Alternative near the Union Pacific Railroad (UPRR) tracks, has CTA talked with Union Pacific representatives?
A: CTA has had preliminary conversations with UPRR and will continue to coordinate with the railroad as plans proceed. The UPRR requires that the CTA tracks be located at least 50 feet from the existing freight tracks due to safety considerations.

Q: Can engineering design be done at the same time as the Environmental Impact Statement is being drafted?
A: As part of the new Moving Ahead for Progress in the 21st Century Act (MAP-21) policy, environmental review is completed during the Project Development Phase. The Engineering Phase is the next step, during which engineering and design is completed. The timing for the Engineering Phase is subject to funding availability and federal approvals. Currently, CTA has not secured approval and funding for the Engineering Phase.

Q: How does work on the other Red Ahead projects affect progress on the Red Line Extension?
A: Red Line Extension project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The Red Ahead program consists of separate projects with their own separate sources of potential funding and timelines. These projects are mutually beneficial and are combined into the Red Ahead program to ensure that they are coordinated efficiently.

Q: What portion of the extension would be elevated?
A: The UPRR Rail Alternative would operate on an elevated structure from approximately 95th Street up to 119th Street, where it would transition to an at-grade profile and then continue at grade before terminating in the vicinity of 130th Street. The terminal station would be at-grade, whereas other stations would be elevated. The Halsted Rail Alternative would operate on an elevated structure from 95th Street to the intersection of Halsted Avenue and Vermont Avenue and all stations on this alternative would be elevated.

Q: Would this extension connect to existing Metra Electric or South Shore services?
A: There is potential for connection of the proposed Red Line Extension to the Northern Indiana Commuter Transportation District (NICTD) South Shore Commuter Rail Line in the vicinity of 130th Street, where the two lines would

be adjacent to each other. This potential connection will be explored in further detail during the engineering phase. A connection between the Red Line Extension and Metra Electric District at Kensington/115th Street station is not possible, as the proposed Red Line Extension routing crosses the Metra Electric District Line approximately one-half mile to the south of the Kensington/115th Street station.

Q: Is CTA coordinating with Metra on the Red Line Extension?
A: CTA is coordinating with Metra on our progress with the Red Line Extension project. Metra is a participating agency in the environmental review process for the Red Line Extension.

Red Line Extension

cta

You're invited to attend a CTA open house on the

Red Line Extension Project

Since the RLE Project open house meeting during the summer of 2011, we have been preparing a Draft Environmental Impact Statement (EIS) based on the technical analysis of impacts of the alternatives. Findings from this preliminary impact analysis of the alternatives will be discussed at the Open House. CTA welcomes your comments and feedback about the RLE Project alternatives and potential impacts, which will be incorporated into the Draft EIS.

This project is one part of CTA's Red Ahead Program, a comprehensive initiative for maintaining, modernizing, and expanding Chicago's most-traveled rail line.

When and where?

Tuesday, May 13, 2014
5:30 to 7:30 p.m.

Palmer Park Gymnasium
201 E. 111th Street
Chicago, IL 60628

This location is served by: CTA Bus #34, #111, #119; Pace Bus #353; and Metra Electric 111th Street (Pullman).

This facility is accessible to people with disabilities.

CTA weighs two options for Red Line extension route

TUE, 04/15/2014 - 6:13PM

FRAN SPIELMAN AND ROSALIND ROSSI
@FSPIELMAN | EMAIL

The CTA has narrowed to two the routes for a long-awaited Red Line extension from 95th to 130th Street — one down the middle of busy Halsted Street, the other mostly running along existing freight tracks.

Ald. Anthony Beale (9th), whose South Side ward would be most heavily affected by the extension, was briefed on the options Tuesday. The chairman of the City Council’s Transportation Committee emerged with a ringing endorsement of the alternative that steers clear of Halsted.

That option for the $2 billion, 5-mile-plus extension generally follows freight tracks operated by the Union Pacific Railroad. A large portion of the tracks run along Eggleston — four blocks west of the existing 95th Street station — and curve eastward as they move farther and farther south.

The CTA’s plan calls for four new stations: at 103rd, 111th, 115th and 130th, with a combined total of up to 2,000 “Park & Ride” spaces, the alderman said.

In addition, construction of a new, $240 million station at the end of the current Red Line, at 95th Street, is due to begin this year and follows massive improvements to Red Line track from Cermak to 95th, completed last October.

“Halsted Street is wide open. Putting elevated tracks down the middle of the street would disrupt the integrity and cosmetics of Halsted. It would hurt existing businesses. I don’t think anybody wants that,” Beale said.

CTA President Forrest Claypool could not be reached for comment on Tuesday’s briefing.

Union Pacific spokesman Mark Davis said Tuesday that the CTA approached the railroad about the possibility of extending the Red Line about a year ago and “we haven’t heard anything back since.’’

However, Davis said, “If they want to approach us again, I’m sure our team would be happy to talk with them.’’

Davis noted that CTA trains, which are powered by an electrified third rail, cannot travel on the same tracks as diesel freight trains.

That means the option Beale favors would require the CTA to build its own tracks, either alongside the UP track or above them. Elevating the tracks could present its own set of problems, considering the hazardous materials freight trains sometimes carry. Davis did not immediately know whether any hazardous materials are transported on the portion of UP track in question.

Either way, the CTA would be required to obtain right-of-way from the railroad, Davis said. Another question is whether UP owns a wide enough right-of-way to allow another set of tracks to be built.

“From a safety standpoint, putting a commuter train next to freight lines — you need wider areas. It’s a complex negotiation to make that happen,” Davis said.

Mayor Rahm Emanuel campaigned on a promise to rebuild the 95th Street station and extend the Red Line South to 130th Street.

The mayor also sold aldermen on his risky, $425 million plan to close the Red Line for five months with the argument that the line needed to be rebuilt before it could be extended.

Now that the possible routes for an extension have been narrowed from five to two, the next step is an exhaustive set of community hearings to decide which option South Side residents favor and how much parking they want at each station.

Beale called it “phase four” of seven or eight hurdles that must be cleared before construction can begin — in three or four years, at the earliest.

The biggest question is whether the CTA can persuade the federal government to bankroll the $2 billion project.

Beale believes the chances are good and not just because of the clout Emanuel carries as a former North Side congressman who served as White House chief-of-staff under President Barack Obama.

“That’s a huge ask from the federal government. But, we’ve been talking about the Red Line extension since I was a kid. Since I’ve been chairman, I’ve made this a priority. So has the mayor. I have all the confidence in the world it’s going to happen,” Beale said.

“95th Street is not the end of the city. What about people who need access to jobs downtown and deserve the right get there in a timely manner? Now that we’ve completed the Red Line upgrade and the [$240 million] 95th Street Station reconstruction is about to start, we can walk right into the extension that will finally complete the Red Line from one end of the city to the other.”

If federal funding falls short, Beale said the Red Line extension could be a candidate for Emanuel’s much-ballyhooed Infrastructure Trust to persuade private investors to bankroll projects Chicago can’t afford to build on its own.

That option would likely require CTA riders to pay higher fees to guarantee private investors an attractive return on their money.

“If we have to, we can look at it, but only if it’s the only way,” Beale said.

“We don’t want to put an extra fee on top [of CTA fares]. If we can get the money from the federal government, we can keep the fees down. We’re gonna lean on the federal government for funding first. My emphasis is on the federal government — not the trust."

The extension of the Red Line is part of the CTA's "Red Ahead" project to extend and enhance the CTA's most-traveled rail line. The project includes improvements on the Red Line as well as upgrades to the line it connects into at its north end — the Purple Line — all the way to the last stop, at Linden in Wilmette.

CTA narrows possible routes for proposed Red Line expansion

BY FRAN SPIELMAN AND ROSALIND ROSSI Staff Reporters April 15, 2014 10:04PM

The 95th Street station is now the end of the Red Line. That station is due for a major renovation, and the CTA is looking at routes to extend the Red Line to 130th Street. | Sun-Times File Photo

The CTA has narrowed to two the routes for a long-awaited Red Line extension from 95th to 130th Street — one down the middle of busy Halsted Street, the other mostly running along existing freight tracks.

Ald. Anthony Beale (9th), whose South Side ward would be most heavily affected by the extension, was briefed on the options Tuesday. The chairman of the City Council's Transportation Committee emerged with a ringing endorsement of the alternative that steers clear of Halsted.

That option for the $2 billion, 5-mile-plus extension generally follows freight tracks operated by the Union Pacific Railroad. A large portion of the tracks run along Eggleston Avenue until about 111th Street, then curve east.

The CTA's plan calls for four new stations: at 103rd, 111th, 115th and 130th, with a combined total of up to 2,000 "Park & Ride" spaces, the alderman said.

Construction of a new, $240 million station at the end of the current Red Line, at 95th Street, is due to begin this year and follows massive improvements to Red Line tracks from Cermak to 95th, completed last October.

Elevated tracks "would disrupt the integrity and cosmetics of Halsted. It would hurt existing businesses. I don't think anybody wants that," Beale said.

CTA President Forrest Claypool could not be reached for comment on Tuesday's briefing.

Union Pacific “would be happy to talk” with the CTA about extending the Red Line, spokesman Mark Davis said Tuesday, but he noted CTA trains, powered by an electrified third rail, can’t use the same tracks as diesel freight trains.

That means the option Beale favors would require the CTA to build its own tracks, either alongside the UP track or above them.

Either way, the CTA would be required to obtain right-of-way from the railroad, Davis said. Another question is whether UP owns a wide enough right-of-way to allow another set of tracks to be built.

“From a safety standpoint, putting a commuter train next to freight lines — you need wider areas,” Davis said.

Mayor Rahm Emanuel campaigned on a promise to rebuild the 95th Street station and extend the Red Line South to 130th Street.

Now that the possible routes have been narrowed from five to two, the next step is an exhaustive set of community hearings to decide which option South Side residents favor and how much parking they want at each station.

The biggest question is whether the CTA can persuade the federal government to bankroll the $2 billion project.

Beale believes the chances are good and not just because of the clout Emanuel carries as a former North Side congressman who served as White House chief of staff under President Barack Obama.

“That’s a huge ask from the federal government. But, we’ve been talking about the Red Line extension since I was a kid. Since I’ve been chairman, I’ve made this a priority. So has the mayor. I have all the confidence in the world it’s going to happen,” Beale said.

“95th Street is not the end of the city.”

If federal funding falls short, Beale said the Red Line extension could be a candidate for Emanuel’s much-ballyhooed Infrastructure Trust to persuade private investors to bankroll projects Chicago can’t afford to build on its own.

That option would likely require CTA riders to pay higher fees to guarantee private investors an attractive return on their money.

“If we have to, we can look at it, but only if it’s the only way,” Beale said.

Red Line to get North Side overhaul, while South Siders decry wait

Residents react to the news that 16 buildings could be razed to make way for an expansion for the Brown, Purple, and Red line trains at Belmont.

Residents react to the news that 16 buildings could be razed to make way for an expansion for the Brown, Purple, and Red line trains at Belmont.

By Jon HilkevitchTribune reporter

8:32 p.m. CDT, April 16, 2014

The CTA said Wednesday it is moving forward with a multibillion-dollar overhaul of the Red Line's aging north branch tracks and stations, just hours after South Siders aired complaints to the agency's board that Mayor Rahm Emanuel's promised southern extension of the same rail line was moving too slowly.

CTA officials later said they also were planning a "major announcement" for Thursday about the 5 1/2-mile extension, envisioned to run from the current 95th Street terminal to about 130th Street and feature four new stops.

Despite the strong billing, however, Thursday's disclosure will focus primarily on that project moving deeper into an ongoing environmental impact study, officials said.

It's an incremental step in a long process. Ultimately, the planned rail service enhancement would provide vital transportation links to downtown and other areas of the city from some of the poorest and transit-underserved communities in the U.S., officials have said.

That's in contrast to Wednesday's more definitive announcement that four north-branch stations — Lawrence, Argyle, Berwyn and Bryn Mawr — will be replaced and that track in that area will be upgraded to allow faster trains, starting no sooner than in 2017. That work comes with a commitment of some amount of federal money and would be the first phase of a $4 billion-plus rehab project along the Purple and northern Red lines.

And for Emanuel, getting closer to breaking ground on the extension would likely help to shore up support among African-American voters, which Tribune polling shows has fallen since his election.

But transit officials have not even hinted when construction might begin. That's because the Red Line south extension project, estimated to cost $2.3 billion, has no funding for construction currently.

The 59,000 residents of the Greater Roseland area are "growing impatient" with elected officials about the slow pace of progress on the extension, the Rev. Paul Brown, representing the Zion Temple Missionary Baptist Church and the Developing Communities Project, testified before the CTA board Wednesday. He said "a sense of urgency" is needed.

"I simply do not understand why the communities that seem to have your attention have succeeded while we are clearly failing," Brown said.

The CTA last year spent $425 million to rebuild the tracks on the Red Line south branch from Cermak-Chinatown to 95th Street, cutting up to 10 minutes each way between 95th Street and downtown. A $240 million expansion and overhaul of the crowded 95th Street terminal begins this year. But the Red Line south extension hasn't taken off, despite pledges from a handful of past CTA presidents dating to the mid-1990s.

Current CTA president Forrest Claypool said Wednesday that he cannot speak about earlier decisions.

"Mayor Emanuel has been here less than three years and in that three years I think this has been on a very fast trajectory," Claypool said. "The federal government makes it a very extensive process … where you are basically starting from scratch as a new start. It is very onerous and time-consuming, but we are moving that as fast as possible."

The CTA is counting on federal funding to finance the bulk of the extension work, but current federal transportation spending legislation expires at the end of September and many experts consider it a long shot that a new spending plan will be approved soon.

There is, however, the commitment to some as-yet-unknown level of federal funding for the CTA's modernization of the Red Line north branch and the Purple Line. The multi-year project will involve replacing stations, deteriorated tracks and outdated signals as well as rebuild structure on a 9.6-mile stretch from north of the Belmont station through Evanston to the Linden station in Wilmette.

The overall goals are to increase capacity on the Red and Purple lines by 20 to 50 percent, reduce travel times, alleviate overcrowded station platforms and provide access for transit riders with disabilities, officials said.

The Federal Transit Administration, which allocates money for large-scale transit projects across the nation, recently listed the CTA's Red-Purple Modernization project as the first project in the U.S. eligible for a new pot of money under a so-called "core capacity" program, which is aimed at helping cities renew heavily used transit lines. No specific dollar pledge has been made yet. The U.S. Department of Transportation has recommended spending a total of $275 million in fiscal 2015 on all eligible core capacity projects in the U.S.

The CTA said in documents released in March that it expects to seek $1.5 billion from the FTA to begin the Purple Line and Red Line north branch work. More funding could be sought later from different pots of federal money, officials said.

The CTA said Wednesday that it will start the ball rolling by rebuilding the four contiguous stations that date to the early 1900s, as well as conduct track and structure work on the Red Line north branch, at an estimated cost of $1.13 billion.

"Some of this infrastructure has stood since the last time the Chicago Cubs won the World Series (in 1908)," Steele said.

The Argyle and Bryn Mawr stations were built in 1908, according to the CTA. Berwyn was built in 1916 and Lawrence in 1923. The complete redo will include the installation of elevators to make the stations accessible to disabled riders.

Officials said it is too early to know how the work will affect service.

The North Side project's total cost is $4.7 billion, according to the FTA.

In addition to the four stations, the nearby Wilson station will also be rebuilt as part of a previously announced and already funded $203 million project that is set to begin this fall.

Meanwhile, an extension of the Red Line south branch has been sought for decades by South Siders, and at different points in time labeled as a high priority by mayors and CTA presidents. In August 2009, the CTA board made it official by voting to extend the line.

The preferred route that the CTA identified in 2009 would operate on an elevated structure that heads south from 95th Street along the median of I-57 for nearly one-half mile until reaching a corridor owned by the Union Pacific Railroad, in the vicinity of Eggleston Avenue.

It would then turn south along the UP corridor to approximately 111th Street, where it would turn southeast. East of South Prairie Avenue, the alignment crosses over the Canadian National/Metra tracks near 119th Street, where it transitions to ground level and then continues southeast along the former Michigan Central/Indiana Harbor Belt railroad right-of-way to terminate in the vicinity of 130th Street.

The extension would include four stations near 103rd, 111th, 115th and 130th streets. Each new station would include park-and-ride lots and bus terminals to serve connecting riders, officials said.

Emanuel said the Red Line extension was his No. 1 transportation priority when he was campaigning for mayor, and CTA officials say the extension remains a top priority.

But riders like lifelong Chicago resident Phyllis Johnson, who spoke at a CTA board meeting Wednesday before the agency released information on either Red Line project, question whether it’s the case.

“What can we do to get this ball rolling to resolve this problem?” said Johnson, a resident of the Roseland community. “Wouldn’t you agree with me that it is way beyond time to extend the CTA Red Line?”

That skepticism is common on the South Side, said Ald. Howard Brookins, 21st, when reached by the Tribune on Wednesday.

“I think a lot people think that it’s so far off that it won’t occur for another 20 years,” he said.

He said South Siders tend to feel shortchanged with it comes to public transportation, because other areas of the city have multiple CTA and Metra lines.

CTA plans Red Line improvements on North, South sides

By ROSALIND ROSSI Transportation Reporter April 17, 2014 1:10AM

North and South Side riders of the CTA's busiest rail line — the Red Line — should see improvements under plans outlined Wednesday.

For North Siders, the CTA could begin work as early as 2017 on a $1.13 billion plan to upgrade track and rehab four stations, from Lawrence to Bryn Mawr.

The stations are among the oldest in the system, officials said. Bryn Mawr was built in 1908, when the Cubs last won the World Series.

The project is contingent on funding, but the CTA hopes to bankroll it with new federal "core capacity" money that can be tapped by older transit lines.

For South Siders, President Forrest Claypool insisted Wednesday that the CTA is "putting the pedal to the metal" on a long-awaited plan to extend the south end of the Red Line from 95th Street to 130th.

One CTA user, Phyllis Johnson, told CTA board members Wednesday that the extension once promised by former Mayor Richard J. Daley after the Red Line opened in 1969 is "becoming the dream deferred.'' Other lines have been extended or created while the Roseland community, which would be affected by an extension, has sat by with no transit developments, Johnson said.

The layers of requirements needed to win federal money for the $2 billion project are "onerous," Claypool said, but Mayor Rahm Emanuel is "putting this on a faster trajectory than previous administrations.''

Emanuel campaigned on extending the Red Line and has emphasized the project since his election, Claypool said.

“Mayor Emanuel’s mandate to us is to modernize the Red Line, from top to bottom, from north to south, and that’s what we’re doing,’’ Claypool said.

The CTA’s “preferred” extension method would be to run an elevated track from the 95th Street station, along Interstate 57 to 98th Street, where the elevated tracks would run parallel with some Union Pacific freight tracks to 130th Street, Claypool said. The tracks could run to the east of UP’s right of way or to the west, CTA officials said. The CTA also had considered building inside the UP’s right of way, but UP has ruled that out, a UP spokesman said.

Although the UP route is the top option, the CTA must give federal authorities at least two more, Claypool said. They include running the rail extension down Halsted Street — something local Ald. Anthony Beale (9th) opposes — or doing a less expensive bus-rapid transit route to 130th.

Beale said Tuesday he was briefed on only two plans — the UP route and the Halsted route, leading him to believe the CTA had only two options under active consideration.

“I can see how he might have perceived it that way because that’s where the focus of the conversation was,’’ Claypool said. “But there’s always been a federally required third alternative, which is the BRT.’’

Claypool conceded that land will have to be acquired as part of the extension project, although it’s too early to say where or how many parcels.

The next step involves publication of the final environmental impact study in 2015, Claypool said.

On the North Side, the planned improvements are part of a larger project to rejuvenate the Red Line and Purple lines, from the Belmont station to the Linden Station in Wilmette. Project estimates have ranged from $2 billion to $4 billion.

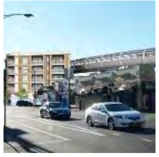
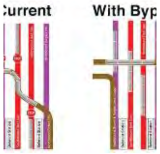
CTA Officially Announces Red Line South Extension, Red/Purple Line Renovation

A rendering of the proposed Belmont Overpass.(*Chicago Transit Authority*)





Chicago Transit Authority formally released details of its planned renovations of the Purple Line and Red Line north branch and the long planned extension of the Red Line's south branch Thursday and let's just say we're cautiously optimistic that maybe CTA has done some solid planning.

We already know the first phase of the project, set to begin in 2017, will involve rehabbing the Lawrence, Argyle, Berwyn and Bryn Mawr Red Line stations and replacing tracks for the Red and Purple Lines at those stations to reduce slow zones. CTA has started the process of securing federal funding to extend the Red Line from its current southern endpoint at 95th Street to 130th Street, using existing freight rail tracks. That project would cost $2.3 billion.

The aspect of the Red/Purple Line rehab we're most impressed by is a "Belmont bypass" allowing the Brown Line to continue along its route by riding above the existing Red and Purple Line rails. Currently the Brown Line has to negotiate its route by crossing those rails, resulting in 40 percent of weekday trains being delayed by up to three minutes.

In order for the bypass to be built CTA will have to buy 16 buildings between Belmont Avenue and Addison Street in order to make room for the project. The total cost of the Belmont bypass is included in the $1.7 billion cost the first phase of Red and Purple Line rehab is expected to cost.

CTA has been busy with infrastructure improvements lately. They rebuilt the Red Line's south branch last year at a cost of $425 million, spent $86 million renovating and rehabbing seven stations on the Red Line north branch two years ago, and work will begin later this year on extensive renovations to the 95th Street and Wilson Red Line stations. "With both the Red and Purple Modernization and Red Line Extension projects, we'll replace outdated infrastructure with a modern, efficient rail, and build more than five miles of new track," CTA President Forrest Claypool said. "Together these improvements will offer CTA customers faster, more reliable service, and increasing access to quality rail transportation for thousands of future riders."

CTA Announces Plans For Red Line Extension and Rehab

Plans to extend the Red Line past 95th Street, rebuild oldest North Side stations

By **Colleen Connolly**

Thursday, Apr 17, 2014 | Updated 5:04 PM CDT

The CTA is planning to overhaul tracks on the North Side's Red, Brown and Purple lines, and expand Red Line service on the far South Side. Charlie Wojciechowski has details.

Red Line riders have something to look forward to in the coming years.

Chicago Transit Authority officials announced Thursday plans for rehabbing five North Side stations and building a long-awaited South Side extension. The projects are part of the first phase of the city's Red and Purple Modernization program.

The stations at Wilson, Lawrence, Argyle, Berwyn and Bryn Mawr were specified for the rehabilitation, which could begin as early as 2017. The five stations are among the oldest, having been built between 1908 and 1923.

The CTA also announced plans to build a Red-Purple Line bypass north of Belmont to eliminate delays and speed up train service where the Red, Purple and Brown Lines intersect.

On the South Side, the CTA plans to extend tracks for 5.3 miles and add four new Red Line stations south of 95th Street. Stops would be located at 103rd, 111th, 115th and 130th Streets, and up to 2,000 “Park and Ride” spaces would be added.

No date has been set to begin the construction of the new stations, but plans for the route have been narrowed down to three options. The first option is to build tracks parallel to the Union Pacific freight tracks from 98th Street to 130th Street. The second option is to build elevated tracks above Halsted Street. The final option is to build a bus-rapid transit route to 130th Street.

Last year, the CTA closed nine Red Line stops south of Roosevelt Road as part of the Red Line South Track Renewal Project. The $425 construction project repaired the crumbling tracks and reduced commute times.

Far South Side Residents Endorse Red Line Extension

April 18, 2014 6:11 PM

Dorothy Tucker

(CBS) – The CTA has an ambitious proposal in the works: extending the Red Line from 95th Street south to 130th, with four new stops along the way.

CBS 2's Dorothy Tucker has reaction from CTA riders.

Timothy Thomas rises every morning at 5 to catch the Pace bus near 130th.

"It's not always accurate," he says of the schedule.

But the bus is the only way to connect to the CTA train on 95th, which gets him to his job downtown. "So, if the Red Line were extended it would be great," Thomas says.

One hundred and thirtieth would be the new last stop on the Red Line extension. New, too, would be stops at 115th, 111th and 103rd. That's where Kelia Louis now catches the bus.

"That would be very convenient," Louis says.

The extension would shave 10 to 15 minutes off Louis' commute from Chicago's South Side, and even more for suburban commuters.

The Times of Northwest Indiana

http://www.nwitimes.com/news/local/illinois/chicago/southeast-chicago-residents-awaiting-proposed-red-line-extension-to-th/article_b5c42660-b95d-5eff-8b39-fd190ef09e0a.html

Southeast Chicago residents awaiting proposed Red Line extension to 130th Street

April 20, 2014 1:00 am • Gregory Tejeda Times Correspondent

CHICAGO | When Peggy Salazar, of the Slag Valley neighborhood, needs to travel to downtown, her commute is longer than that of many suburban residents who live farther away.

Her community has only one Chicago Transit Authority route that leads downtown. It's a No. 30 South Chicago bus route that works its way from the Hegewisch station on the South Shore line at Brandon and Brainard avenues north to the Red Line train line at 69th Street.

"It's a long, slow kind of route," she said of the commute that can take 1 1/2 hours to complete.

Salazar and others at Chicago's southern end were interested in the news the CTA is looking at improvements on the Red Line trains.

For now, the focus is on building a bypass meant to ease congestion on CTA train lines that service North Side neighborhoods. CTA officials said they're also submitting applications to federal agencies for more funding for an expansion of the Red Line trains south to 130th Street.

CTA President Forrest Claypool said money is to complete environmental impact studies that began in 2011 and are required before engineering studies on the extension proposal can begin.

Officials said they will begin a community outreach program this spring meant to get local views on the project, while also allowing the CTA to disseminate information to the public about when the long-desired extension would begin. An open house already is scheduled for May 13 at Palmer Park gym, 201 E. 111th St.

What they're going to find is that some people already are working to prepare area businesses and residents for the day when a CTA train route extends nearly to Chicago's far southern border at 138th Street.

Michael LaFargue, president of the West Chesterfield Community Association, said his group and several other far South Side community organizations meet regularly to discuss the extension, which they say will revitalize businesses in their area by making it easier for people to travel so far south in Chicago.

“We want any businesses located near the train stations on the extension to be ready when it takes place,” LaFargue said, adding it also would allow people to work jobs outside their home neighborhoods.

“It will provide motivation for many unemployed people to go out and get a job if we make it easier for them to get to work,” he said.

LaFargue said he and other activists will be watching closely as CTA and City Hall officials act on the project.

“We’re hoping this doesn’t get bogged down by politics, because this is a very important project,” he said.

Currently, the Red Line goes south down the middle of the Dan Ryan Expressway as far as 95th Street. In 2009, the CTA’s governing board approved the concept of an extension to add stations in the Roseland neighborhood at 103rd Street, 111th Street, 116th Street and Michigan Avenue, and a final station at 130th Street near the Bishop Ford Freeway in between the Hegewisch neighborhood and the Altgeld Gardens public housing complex.

CTA officials do have an alternate route in mind that would go south along Interstate 57, then become an elevated train on Halsted Street ultimately winding up at 127th Street in Blue Island, if negotiations with the Union Pacific Railroad are unsuccessful in getting access needed to make the 130th Street extension.

But CTA officials say the route to 130th Street is the “locally preferred” route that community officials have expressed support for.

Cheryl Johnson, an Altgeld Gardens resident and head of the People for Community Recovery group, said she and her neighbors are “confident” the day will come when the extension will be built.

“Chicago is a big city that stretches so far south,” Johnson said. “It isn’t right that such a large part of it doesn’t have train access.”

She also said that with plans to build extensive parking lots around a 130th Street station to accommodate commuters, it might be possible for people from nearby suburbs such as Calumet City and Dolton to also begin using CTA trains on a regular basis.

“This would help revitalize the entire area,” Johnson said. Agreeing was Peggy Salazar, executive director of the Hegewisch-based Southeast Environmental Task Force, who said people from other parts of Chicago often have trouble getting to the 10th Ward.

“When we try to bring in interns, it is hard for them to get here if they don’t happen to drive,” she said. “If they extend the trains and put in a 130th Street bus, it would really help improve the connection between Hegewisch and the rest of Chicago.”

The Chicago Maroon

Multi-billion boost to Red Line

CTA PLANS TO EXPAND RED LINE TO 130TH STREET.

Posted Apr 21, 2014 by Felicia Woron

Chicago Mayor Rahm Emanuel and the Chicago Transit Authority (CTA) recently announced plans to begin renovations of the Red and Purple Lines in 2017. The CTA hopes to begin an extension of the Red Line further south after these renovations are completed.

The agency plans to replace parts of tracks on the Red and Purple Lines as well as build at least five miles of new track as an extension of the Red Line. The Red Line currently runs from 95th Street to the Uptown neighborhood, remaining parallel for much of its length to the Purple Line, which runs from the Loop to Wilmette, a suburb north of Evanston.

In a $1.7 billion project, what CTA President Forrest Claypool described in a CTA press release as “outdated infrastructure” will be replaced with “modern, efficient rail.” Most Red and Purple Line tracks are nearly 100 years old, and a significant amount of time and money is currently spent on repairs, hindering service greatly, according to the press release. These tracks will be replaced and five stations originally built between 1908 and 1923—Wilson, Lawrence, Argyle, Berwyn, and Bryn Mawr—will be completely rebuilt, with new elevators to improve accessibility.

According to the press release, in a spot north of the Belmont station in the Lakeview neighborhood where the Red, Purple, and Brown Lines all intersect, delays of up to three minutes often occur because trains on the Red and Purple Lines must wait for Brown Line trains to cross. In order to remedy this, a bypass will be built, allowing the Brown Line to cross over the Red and Purple Lines. According to an article in*Chicagoist*, the CTA will have to buy 16 buildings between Belmont Avenue and Addison Street in order for this bypass to be built, which is included in the $1.7 billion cost of the first phase of the project.

The second phase is a $2.3 billion endeavor in which the Red Line will be extended from 95th Street through the Roseland community south to 130th Street, a low-income area that largely depends on public transit but lacks the infrastructure that is available in other areas. The project is expected to shorten the commute from 130th Street to downtown by 20 minutes, allowing better access to education and jobs downtown, according to the CTA press release.

Progressive Railroading

http://www.progressiverailroading.com/passenger_rail/news/CTA-unveils-first-phase-of-modernization-project-Red-Line-extension-environmental-steps--40170

Rail News: Passenger Rail

CTA unveils first phase of modernization project, Red Line extension environmental steps

Chicago Transit Authority (CTA) officials late last week announced the first phase of the Red and Purple modernization program to rebuild the northern section of the Red Line and the parallel Purple Line.

They also announced the beginning of the next step in a federal process to secure funding for the Red Line extension project, which would extend the Red Line south from 95th Street to 130th Street, according to a CTA press release.

The CTA's Red Line, which runs 24/7 along 23 miles of tracks, is Chicago's busiest rail line with about 75 million annual rides.

The first phase of the Red and Purple modernization improvements will include two main components: station and track modernization from Wilson to Bryn Mawr, which entails rebuilding the Wilson, Lawrence, Argyle, Berwyn and Bryn Mawr stations and rebuilding all track, support structures, bridges and viaducts for the Red and Purple lines between Lawrence and Bryn Mawr; and construction of a Red-Purple bypass north of the Belmont Station.
The first phase of the Red and Purple modernization is estimated to cost $1.7 billion.

The 5.3-mile Red Line extension project will extend south from the 95th Street Terminal through the greater Roseland community. Plans include construction of four new stations near 103rd Street, 111th Street, Michigan Avenue/116th Street and 130th Street, all with bus and parking facilities.

In 2011, the CTA received funding from the Federal Transit Authority to conduct the Environmental Impact Statement for the Red Line project — a major step in the multi-step federal process to secure approval and funding of the $2.3 billion dollar project, authority officials said.

The CTA will host the following open houses to solicit public comments on the projects: May 13 for the Red Line project; May 21 for the Lawrence-to-Bryn Mawr modernization; and May 22 for the Red-Purple bypass.

Illinois Construction and Business News

IL - CTA Announces Next Steps in Modernizing the Red Line

April 23, 2014

CTA President Forrest Claypool recently announced the first phase of its Red and Purple Modernization (RPM) program.

Mayor Rahm Emanuel and CTA President Forrest Claypool recently announced the first phase of its Red and Purple Modernization (RPM) program, which will completely rebuild the northern section of the Red Line and the parallel Purple Line, and beginning of the next step in a federal process to secure funding for the Red Line Extension plan, which would extend the Red Line south from 95th Street to 130th Street.

These are the latest steps in the ongoing modernization of the CTA under Mayor Emanuel.

“As a world-class city, Chicago has a world-class transit service to connect residents to jobs, education, culture and above all opportunity,” said Mayor Emanuel. “CTA is investing in modernizing the Red Line as part of our strategy to create a seamless, safe, and reliable transportation system for every neighborhood.”

The CTA’s Red Line, which runs 24/7 along 23 miles of tracks, is Chicago’s busiest rail line with about 75 million annual rides.

The Red and Purple Modernization program and the Red Line Extension project are the latest in a series of Red Line projects to modernize and extend the backbone of the CTA’s rail system that have been undertaken since 2011.

With a significant portion of the Red Line built more than a century ago, the improvements would address the current need to expand capacity by building new infrastructure to accommodate growing ridership. Additional Red Line modernization projects under Mayor Emanuel include:

- Successful $425 million replacement of the Red Line South railroad in 2013, as well as station rehabilitations.
- $86 million renewal and rehabilitation of seven far north side stations in 2012.

- $240 million new 95th Street Terminal, work beginning in late summer.
- $203 million Wilson station reconstruction and track and signal replacement, major construction to begin this fall.

“These projects are the next steps in our overall vision to rebuild, modernize and expand the entire Red Line,” said P President Claypool. “We’re already kicking off Red and Purple Modernization by beginning reconstruction of the Wilson station this fall and continuing progress on the South Side by starting the new 95th Street Terminal this summer, following the successful completion of the Red Line South reconstruction last year. With both the Red and Purple Modernization and Red Line Extension projects, we’ll replace outdated infrastructure with a modern, efficient rail, and build more than five miles of new track. Together these improvements will offer CTA customers faster, more reliable service, and increasing access to quality rail transportation for thousands of future riders.”

The CTA is also moving forward with its proposed Red Line Extension plan by beginning the second step of its environmental process to ultimately finish the Environmental Impact Study, which is required to begin engineering on the plan to extend the Red Line south of 95th Street to 130th Street. Both projects will include a broad community outreach process that will begin next month to solicit community feedback on both projects and provide updates on the funding process for each project.

About Red and Purple Modernization

The RPM program will proceed in phases to fully replace old, deteriorating infrastructure and stations along the entire north branch of the Red Line and the parallel Purple Line, and will pave the way for CTA to significantly increase train capacity for the next 80 years.

This section of the Red and Purple lines carries one out of every five CTA rail rides and serves customers in some of the densest, most diverse neighborhoods in Chicago. Rush-hour ridership has jumped 40 percent in the last five years alone.

Most tracks and bridges along the Red and Purple lines are nearly 100 years old. Despite rising demand, the CTA is unable to increase capacity because of the current infrastructure’s age and structural limitations. Continuing to operate a busy rail line on this outdated infrastructure results in high maintenance costs, the need for frequent repairs that disrupt service and slow travel, as well as outdated stations that can’t accommodate elevators or other necessary and modern amenities.

RPM will create a completely rebuilt rail line, resulting in faster, smoother rides, modern, fully ADA accessible stations along the entire corridor and more frequent train service to alleviate overcrowding.

The first phase of the RPM improvements will include two main components:

- **Station and track modernization, Wilson to Bryn Mawr:** Completely rebuilding the Wilson, Lawrence, Argyle, Berwyn, and Bryn Mawr stations and rebuilding all tracks, support structures, bridges and viaducts for the Red and Purple lines between Lawrence and Bryn Mawr. Replacement of the Wilson station and surrounding infrastructure begins this fall. These stations were built originally between 1908 and 1923 and the elevated support structures date back to the 1920s. The Bryn Mawr station was last updated 40 years ago, in 1974; the remaining three stations received interim station renewal work in 2012. Reconstruction of these stations will include adding elevators at each to make them accessible to customers with disabilities. The project also includes rebuilding the tracks, signals and support structures, which will significantly improve train speeds and service reliability on the slow zone-plagued stretch. (The Wilson station project is already funded from state, federal and local sources, and is currently proceeding through a separate Environmental Assessment process.)
- **Construction of a Red-Purple bypass.** Construction of a bypass north of the Belmont station to eliminate delays and speed up train service where the Red, Purple and Brown lines currently all intersect. The current configuration requires trains on three of four tracks to stop and wait for Brown Line trains to cross, which results in more than 40 percent of weekday trains being delayed by as much as three minutes. About 150,000 rides travel through this intersection each weekday, all of which are slowed down because trains must stop and wait for signal clearance. The structure's original 1907 design makes it difficult, under present day and service demands, to provide reliable service and makes adding service extremely challenging.

"Modernizing Red Line rail service and stations strengthens our neighborhoods by making transit more reliable and ultimately generating new economic development near revitalized stations," said Ald. Harry Osterman. "We're pleased that Mayor Emanuel and the CTA recognize the importance of safe, reliable transit in neighborhoods near the Red Line, including Andersonville, Edgewater and Uptown, and look forward to working closely with the CTA on this exciting program."

Future phases of RPM will bring the same level of infrastructure and station improvements to the remaining sections of the Red and Purple lines, from north of Belmont station to Linden station in Wilmette.

Estimated cost for the first phase of RPM is $1.7 billion.

In November 2013, the CTA became the first transit system accepted into the Federal Transit Administration's (FTA) new Core Capacity Program that provides funding to transit systems to add capacity on existing infrastructure for future ridership growth. The RPM project is eligible for 2014 Core Capacity federal funding approved by Congress earlier this year.

About RLE

The 5.3-mile Red Line Extension project will extend south from the 95th Street Terminal through the greater Roseland community. Plans include construction of four new stations near 103rd Street, 111th Street, Michigan Avenue/116th Street and 130th Street, all with bus and parking facilities.

The RLE project will provide rapid transit rail access to a low income, transit-dependent Far South Side area that does not have direct CTA rail service. An extended Red Line will provide up to a 20-minute time savings to downtown by providing one-seat service, as opposed to the current bus-rail trip from 130th Street. It will also improve access to jobs and education, and foster economic development.

In 2011, the CTA received funding from the FTA to conduct the Environmental Impact Statement (EIS) for the RLE project—a major, important step in the multi-step federal process to secure approval and funding of the $2.3 billion dollar project.

Public Input and Next Steps

The CTA will meet with community groups and host public open houses to share details and seek input on the proposed RPM and RLE projects. Members of the public can submit formal comments directly to the CTA or at public open houses where CTA and representatives will provide additional information on RPM and RLE project plans. For each project, CTA is seeking community input on the location, design, and social, economic, and environmental effects of the proposed improvements.

The Lawrence to Bryn Mawr Modernization Open House will be held Wednesday, May 21, at Truman Community College, 1145 W. Wilson Ave. from 5:30 p.m. to 7:30 p.m.

The Red-Purple Bypass Open House will be held Thursday, May 22, at the 19th District Police Station, 850 W. Addison St., from 5:30 p.m. to 7:30 p.m.

The RLE Open House will be held Tuesday, May 13, at Palmer Park Gymnasium, 201 E. 111th St., between 5:30 p.m. and 7:30 p.m.

Comments for either project can also be submitted by email or postal mail to:

RPM@transitchicago.com

RedExtension@transitchicago.com

Chicago Transit Authority Strategic Planning, 10th floor Attn: RPM Project or RLE Project 567 W.
Lake Street Chicago, IL. 60661-1465

Following public input, the CTA will deliver draft environmental studies for both RPM Phase One and RLE to the FTA as part of the process to request federal funding. Timing for construction starts on each project is dependent upon the receipt of funding for each project. By the beginning of May, the CTA will release a request for Letters of Interest and Qualifications (LIQ) for Preliminary Engineering (PE) services for Phase One of RPM.

The CTA is moving forward with its plan to build a $2.3 billion extension to the south end of the Red Line.

By Leah Hope

Wednesday, May 14, 2014

CHICAGO (WLS) --
The Chicago Transit Authority is moving forward with its largest expansion project in decades. The CTA is planning a $2.3 billion extension to the south end of the Red Line.

Currently, 95th Street is the end of the line. CTA Red Line riders that go farther south rely on buses.

"It's a two and half trip for me, two buses and one 'L' train, each way from the doctor probably four or five times a month," said John Schellenbach, CTA rider.

A five-mile Red Line extension would be welcomed news to riders Eyewitness News spoke with on Wednesday.

"Out that way it's kinda hard catching the buses, you know, sometimes they're late. And just for the Red Line to go further, I think that would lessen traffic conditions also," said Sandra Cotton, CTA rider.

On Tuesday night, CTA held an open house to offer more information and get feedback. The agency is just starting the process to make the extension a reality. There are five possibilities currently, from adding new rail lines to a bus rapid transit line extended south to 130th Street.

"Our impact on natural habitats, historic properties, neighborhoods, up and down the list of concerns when you talk about churches, schools, homes," said Steve Mayberry, CTA spokesman.

A local community organization advocates for the extension to help residents in the area and the city as a whole.

"This has been something the community has desperately needed. Transit brings about business, better job opportunities, economic development," said Tiffany Hightower, Developing Communities Project.

While many support the idea of extending the Red Line, the project is still a few years out. The CTA plans to submit an environmental impact statement next year on one of those possibilities.

http://www.chicagonow.com/cta-tattler/2014/05/nearly-100-buildings-would-be-razed-to-build-preferred-red-line-south-extension/

Nearly 100 buildings would be razed to build preferred Red Line south extension

By **Kevin O'Neil***, Wednesday at 6:58 pm*

Almost 100 residential buildings could be torn down if the "locally preferred alternative" for the the Red Line south extension were to be built. That's what the CTA revealed at a community meeting Tuesday night.

More than 250 total land parcels would have to be acquired for the "preferred" extension alternative. From the CTA website:

> The proposed UPRR Rail Alternative would extend the heavy rail transit line from the existing Red Line 95th Street Terminal to 130th Street. The UPRR Rail Alternative would operate on an elevated structure heading south from 95th Street along the I-57 Expressway for nearly one-half mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of South Prairie Avenue, the alignment would cross over the Canadian National/Metra Electric tracks near 119th Street, where it would transition to an at-grade profile and then continue southeast along the Northern Indiana Commuter Transportation District Chicago South Shore & South Ben Railroad (NICTD/CSS & SBRR) right-of-way using a portion of the Indiana Harbor Belt (IHB) alignment to terminate at 130th Street.
>
> **The Locally Preferred Alternative would include the following features:**
>
> - Transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2010-2015 Transportation Improvement Program as described in the No Build Alternative
> - 5.3-mile heavy rail transit line extension from 95th Street Terminal to 130th Street
> - Four new stations at 103rd Street, 111th Street, Michigan Avenue, and 130th Street

- New park & ride and bus terminal facilities at each station
- Bus transit service from the south to the new stations for faster travel to downtown Chicago
- New yard and shop at 120th Street

The Sun-Times reported on the impact of other alternatives:

> If an elevated were built west of the UP tracks, up to 195 parcels would need to be purchased, 30 of them residential.
>
> Another alternative, which would run the extension down the center of Halsted Street, would require seizing 110 parcels, including 17 residential ones.
>
> A final option, involving a bus “rapid transit” system with dedicated bus lanes, would require seizing only 52 parcels, including one residential one.
>
> In comparison, the CTA seized 40 parcels before a project to expand capacity on the Brown Line, completed in 2009.
>
> No estimate of the maximum number of people displaced by each alternative was available.

There were lots of North Siders unhappy about just 16 buildings that would have to be razed if the Belmont Flyover is built. And yet I haven't heard the same cries on the Far South Side about the nearly 100 buildings with targets on their roofs. Maybe word hasn't gotten out yet.

CTA Could Consume 259 Properties For Red Line Extension

Wednesday, May 14, 2014, by AJ LaTrace

[photo by Flickr user vxla]

Last night at an open house, the CTA laid out its complete **$2.3 billion** plan to extend the Red Line south to 130th Street, and revealed that in order for the ambitious expansion to happen, the transit agency would need to acquire **259 properties** along the path. The Red Line currently ends at 95th Street, and the extension would add **5.3 miles** of new track to the busy transit line. In addition to shortening commute times for South Side residents going to the Loop, the city believes that the extension would connect the neighborhoods to much needed jobs, green space, educational institutions and medical facilities. Of the 259 properties needed to complete the project, 95 contain residential buildings. The city has been ambitious with transit updates and expansions lately, however, the Red Line extension would be the CTA's biggest since the Blue Line was extended to O'Hare in the early 80s.

Whistleblower off-base on CTA budget, Claypool says

BY ROSALIND ROSSI AND FRAN SPIELMAN Staff Reporters May 14, 2014 6:04PM

Updated: May 15, 2014 2:21AM

A former CTA employee who says he was axed for blowing the whistle on what he called unrealistic budget projections “has no clue what he’s talking about,’’ CTA President Forrest Claypool said Wednesday.

And the fact that, through March, the CTA’s 2013 budget is coming in at $3.8 million less than projected is no big deal, Claypool told reporters after the CTA’s monthly meeting.

“We have another eight, nine months to deal with a two-tenths-of-one-percent variance, which is a rounding error in a budget of this size,’’ Claypool said.

The CTA will adjust expenses throughout the year to make sure the agency ends the year in balance, Claypool said. Some of the variance was blamed on a brutally cold and snowy January and February that left first quarter fare revenues $3 million under projections.

Claypool’s comments came about a week after former CTA employee Casey Loop filed a whistleblower lawsuit against the transit agency, charging he was told he was being laid off less than three months after he tipped off the RTA that the CTA’s 2013 budget had been packed with what he considered unrealistic and even “astonishing” projections.

They included a $56 million labor “credit” based on an assumption that 347 vacancies would remain vacant for an entire year, Loop said. Normally, budgets assume vacancies will not be filled for about three months, allowing for a 25 percent savings, said Loop.

However, Claypool said Wednesday the 2013 budget assumed a “reasonable” percent of the agency’s 11,000 total positions would be vacant during the year.

“Every public budget has a reasonable allowance to reflect the fact that there are savings and salvage from the fact that all those positions aren’t filled throughout the year,’’ Claypool said. “The CTA is no different than the city of Chicago, Cook County, the Park District.’’

Claypool said Loop “just didn’t understand” and “has no clue what he’s talking about.”

Loop’s suit states he was hired in February 2012 as a CTA budget project consultant; given a raise in July 2012; promoted in June 2013 to manager of performance analysis and then told in September 2013 that he was being laid off. However, Claypool insisted Loop did not get the June promotion.

“He was not promoted,’’ Claypool said. “He volunteered to do some budget work, so that’s not a promotion.”

Loop’s attorney, Betty Tsamis, said Wednesday that Loop “came forward in good faith because he believes in open and transparent government.” She added: “We stand behind our pleadings.’’

Claypool also told reporters the possibility that the CTA would have to acquire 259 parcels of land, including 95 residential buildings, to extend the Red Line from 95th to 130th Street was “a normal occurrence for any major extension.’’ Such purchases are not unusual when a transit agency must create a “brand new railroad” in an urban area, Claypool said.

Up to 259 parcels would need to be seized under one of several alternatives being considered. That particular option would place an elevated track mostly east of existing Union Pacific tracks.

Far South Side Ald. Anthony Beale (9th), chairman of the City Council’s Transportation Committee, said Wednesday he’s concerned about the number of residential and business parcels that must be seized to make way for the Red Line extension.

But the alderman said he doesn’t “want to alarm anyone” until the CTA makes a final decision on the precise route.

“At that point, we’ll make sure people are well-compensated, well-protected and not taken advantage of,” Beale said.

As for whether it’s worth displacing hundreds to improve transportation for tens of thousands, Beale said: “We have to do what’s in the best interest of the community.

That is, making sure this 40-year-old promise is kept to run the Red Line to the end of the city. If that means displacement, we can get over that hurdle.”

In other business, Claypool revealed that CTA bus drivers were expected to receive a bulletin Wednesday, reminding them to announce priority seating rules if a disabled rider is unable to find a seat. Priority seating is reserved first for the disabled, then seniors, then riders with strollers.

His comments came after Ray Yung, a disabled rider with crutches, complained that female riders with strollers have refused to give up their priority seats to him.

CTA officials also revealed that the No. 10 bus to the Museum of Science and Industry could be cancelled if its ridership does not increase. The CTA agreed Wednesday to increase the museum’s contribution for that service from $39.28 an hour to as high as $47 an hour over the next two years. However, the bus averages 30 riders an hour; the system average is 50 riders an hour. It needs 106 riders an hour to break even, CTA Chief Planning Officer Carole Morey said.

Museum officials said they are investing $75,000 this year on an aggressive marketing campaign to try to boost ridership.

Chicago Sun-Times

CTA: Hundreds of parcels might be needed for Red Line expansion

BY ROSALIND ROSSI Transportation Reporter May 13, 2014 9:58PM

Updated: May 14, 2014 2:18AM

As many as 259 parcels of land — including 95 with residential buildings — could be seized as part of a Chicago Transit Authority plan to extend the Red Line to 130th Street, officials revealed Tuesday.

The $2.3 billion, 5.3-mile project would be the biggest CTA extension in 30-some years — since the Blue Line was extended to O'Hare, CTA officials said.

About 200 Chicagoans showed up Tuesday night at the Palmer Park Gym, 201 E. 111th St., to view and discuss about two dozen posterboards outlining the project.

"There was a high level of interest,'' said CTA spokesman Steve Mayberry. "Folks wanted as much information as they could get.''

One board in particular outlined what may be the most controversial numbers associated with the project — how many parcels would have to be seized to extend the Red Line to 130th Street from its current endpoint at 95th Street.

The CTA in 2009 selected a "preferred" route down the middle of I-57 to 98th St., and then alongside existing Union Pacific tracks to 130th.

Under that "preferred" route, if an elevated were built east of the UP tracks, a maximum of 259 parcels would need to be purchased, 95 of them residential, the posterboard indicated.

If an elevated were built west of the UP tracks, up to 195 parcels would need to be purchased, 30 of them residential.

Another alternative, which would run the extension down the center of Halsted Street, would require seizing 110 parcels, including 17 residential ones.

A final option, involving a bus “rapid transit” system with dedicated bus lanes, would require seizing only 52 parcels, including one residential one.

In comparison, the CTA seized 40 parcels before a project to expand capacity on the Brown Line, completed in 2009.

No estimate of the maximum number of people displaced by each alternative was available.

CTA Red Line project manager Carole Morey said all alternatives are “on equal footing” and further engineering analysis could reduce some displacements. The community will be asked for input at public hearings after an environmental assessment of each option is completed in 2015, she said.

At that time, Morey said, some citizens may want to endorse alternatives that displace fewer people.

“I think it’s too early to reach any conclusions,’’ Morey said. “We really need to hear from the community and hear their concerns.’’

The extension would run through such impoverished neighborhoods as Roseland and Englewood, and, it is hoped, give businesses there a boost, Mayberry said. It also would trim 20 minutes from the commute of residents near 130th, who would need only to hop a Red line train to get downtown instead of riding a bus to 95th Street and boarding the Red Line there, Mayberry said.

RedEye

http://www.redeyechicago.com/news/redeye-cta-construction-ahead-20140518,0,993517.htmlpage

By Tracy Swartz | REDEYE

You thought winter was a long season? CTA construction season can seem to last forever.

The agency is midway through projects to improve parts of the Blue and Orange line tracks, which means shuttle buses replace train service in those areas on some weekends. Meanwhile, the CTA is overhauling the Harrison Red Line stop in Printers Row, affecting Red Line service and access to that stop since last month.

The Clark/Division stop in Old Town has been undergoing a monthslong renovation that will include a new mezzazine this year. Also, a new Green Line stop at Cermak Road is underway.

And let's not forget about the projects on the horizon—the agency is scheduled to begin turning the Wilson Red Line station into a transfer point for the Purple Line Express. Additionaly, there are plans to overhaul the Quincy Loop station and the 95th Street Red Line stop and combine the Madison/Wabash and Randolph/Wabash stations into a superstation in the Loop.

Future projects that don't have timetables include overhauling Red Line stations from Lawrence to Bryn Mawr on the North Side and creating a bypass north of the Belmont stop in Lakeview to ease Red, Brown and Purple line train traffic there.

The CTA is holding a hearing about the Lawrence to Bryn Mawr modernization project 5:30-7:30 p.m. Wednesday at Truman College, 1145 W. Wilson Ave. A meeting about the Red-Purple Bypass project will be held 5:30 to 7:30 p.m. Thursday at the 19th District Police Department, 850 W. Addison St.

RedEye mapped all current and future rail construction projects below.

» O'HARE BRANCH OF BLUE LINE
CTA fixing slow zones between Belmont and Clinton and working on stations from Cumberland to Grand over the next four years.

» NORTH OF BELMONT RED LINE
The CTA wants to create a bypass for Red, Purple and Brown line travel. Work would begin no earlier than 2017.

» LAWRENCE TO BRYN MAWR ON RED LINE
Station improvements would begin no earlier than 2017.

» WILSON RED LINE
Work on $203 million overhaul expected to begin this year.

» CLARK/DIVISION RED LINE STATION
New mezzanine is slated to open in September. Rest of the work done in 2015.

» WESTERN BLUE LINE STOP (O'HARE BRANCH) TO LOGAN SQUARE BLUE LINE STOP
Closures: May 30-June 2, June 6-9, June 20-23, July 25-28, Aug. 8-11

» HALSTED ORANGE LINE STOP TO ROOSEVELT
Closure: May 30-June 2

» CERMAK GREEN LINE STATION
Work has started on the new $50 million Green Line station.

» INDIANA GREEN LINE STATION
Southbound trains won't stop here from 9 a.m to 2 p.m. May 19-23.

» MADISON/WABASH AND RANDOLPH/WABASH STATIONS
Work has been approved to combine the Madison and Randolph stations into a single $75 million station at Washington.

» QUINCY STOP IN THE LOOP
Work has been approved to overhaul station for $15.7 million.

» HARRISON RED LINE STATION
Closures: May 30-June 2, June 6-9

» 95TH STREET RED LINE STATION
Construction is supposed to begin this year on a $240 million overhaul.

» SOUTHERN BRANCH OF RED LINE
The CTA is looking at extending the Red Line south to 130th Street but no funds or timetable is in place.

ALL DATES ARE SUBJECT TO CHANGE.

Appendix B
April 17th, 2014 Aldermanic Briefing Meeting Notes

MEETING NOTES

RE: **Aldermanic Briefing – Red Line Extension Draft EIS**

MEETING DATE: **Thursday, April 17, 2014 - 10:00 AM**

LOCATION: **City Hall (406A)**

ATTENDEES:

Name	*Initials*	*Organization*
April Branch	AB	Alderman Beale's Office
Brian Sleet	BS	Alderman Sawyer's Office
Carole Morey	CM	CTA
Eva-Dina Delgado	ED	CTA
Gerald Nichols	GN	CTA
Ald. Howard Brookins	HB	21st Ward Alderman
Jeff Wilson	JW	CTA
Lamar Brown	LB	Alderwoman Harris' Office
Loren Harris	LH	Alderwoman Harris' Office
Sonali Tandon	ST	CTA

PREPARED BY: Sonali Tandon

ISSUE DATE:

- ED kicked off the meeting and thanked everyone for attending.
- CM gave a presentation about CTA's Red Line Extension (RLE) project and discussed:
    - the Red Ahead program and different projects that are part of it. She mentioned recent CTA board action on the 95th Street Terminal Project.
    - that CTA is pursuing New Starts federal funds for RLE and the project will have to compete with other New Starts projects in the country. Red and Purple Modernization Project, which is also part of the Read Ahead Program is pursuing Core Capacity federal funds.
    - RLE project history, previous public involvement, and project benefits
    - the Environmental Impact Statement (EIS) process and different project alternatives for RLE
        - HB commented that although Union Pacific Railroad (UPRR) Alternative was the Locally Preferred (LPA) Alternative, it doesn't seem that is where people are and the Halsted Alternative would capture more of Chicago. He also mentioned that attendees that supported the UPRR alternative in previous RLE meetings were from Roseland. He asked if CTA had analyzed population density along different alternatives.
    - potential project impacts and mitigations including park impacts and potential displacements for each alternative

        - BS asked if CTA would provide grants to residents for new windows, if there are noise impacts. CM mentioned that as part of the EIS, CTA is doing detailed noise modeling to identify impacts. Mitigation measures would accordingly be identified.
    - topic areas where minimal impacts are likely to occur
    - project funding and project development process
- BS asked about Park & Ride at 95th Street Terminal. He also requested a map of proposed RLE stops in relation to Metra stops. He also mentioned that Metra stops were not in good condition and difficult locations.
- ED mentioned that CTA will be conducting small community meetings and an Open House meeting.
- RLE collaterals and flyers in English and Spanish were handed out to the attendees and the meeting was adjourned.

Mr. Matt Fuller
Environmental Programs Engineer
3250 Executive Park Drive
Springfield, IL 62703

Re: CTA Red Line Extension (RLE) Project Environmental Review Process Update

Dear Mr. Fuller*:*

The Federal Transit Administration (FTA) as lead agency, in cooperation with the Chicago Transit Authority (CTA) as a joint lead agency, has been working to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) project. The proposed project would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding.

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

In developing the Draft EIS over the last year, CTA has reached out to a number of agencies, including FHWA, regarding input on the impact assessment methodologies and the draft technical analyses in each agency’s area of expertise. As the project moves forward and the Draft

EIS is further developed CTA will continue to coordinate with you on the project developments and submit a pre-draft and pre-final environmental document for your review.

Your agency has previously agreed to be a cooperating agency for this project. At this time, we would like to reconfirm your involvement as a cooperating agency and your contact information. Please respond to confirm the single point-of-contact within your organization for future coordination efforts by emailing Sonali Tandon, CTA Project Manager, at STandon@transitchicago.com with the contact's name, title, and email address. FTA and CTA will use this contact information to provide future updates about the project.

Additional information about the project is available at: transitchicago.com/RedEIS.

Mr. Nicholas Mueller
Regional Environmental Officer
Federal Emergency Management Agency
536 S. Clark St. 6th floor
Chicago, IL 60605

Re: CTA Red Line Extension (RLE) Project Environmental Review Process Update

Dear Mr. Nicholas Mueller:

The Federal Transit Administration (FTA) as lead agency, in cooperation with the Chicago Transit Authority (CTA) as a joint lead agency, has been working to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) project. The proposed project would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding.

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

In developing the Draft EIS over the last year, CTA has reached out to a number of participating agencies regarding input on the impact assessment methodologies and the draft technical

analyses in each agency’s area of expertise. As the project moves forward and the Draft EIS is further developed, as a participating agency, you may be asked to review and comment on sections of the document. This will be your opportunity to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, the anticipated impacts and proposed mitigation.

Your agency has previously agreed to be a participating agency for this project. At this time, we would like to reconfirm your involvement as a participating agency and your contact information. If you are not the right contact within your organization, or would like to designate another person for future coordination efforts, please email Sonali Tandon, CTA Project Manager, at STandon@transitchicago.com with the contact’s name, title, and email address. FTA and CTA will use this contact information to provide future updates about the project.

Additional information about the project is available at: transitchicago.com/RedEIS.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

In developing the Draft EIS over the last year, CTA has reached out to a number of participating agencies regarding input on the impact assessment methodologies and the draft technical

analyses in each agency’s area of expertise. As the project moves forward and the Draft EIS is further developed, as a participating agency, you may be asked to review and comment on sections of the document. This will be your opportunity to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, the anticipated impacts and proposed mitigation.

Your agency has previously agreed to be a participating agency for this project. At this time, we would like to reconfirm your involvement as a participating agency and your contact information. If you are not the right contact within your organization, or would like to designate another person for future coordination efforts, please email Sonali Tandon, CTA Project Manager, at STandon@transitchicago.com with the contact’s name, title, and email address. FTA and CTA will use this contact information to provide future updates about the project.

Re: CTA Red Line Extension (RLE) Project Environmental Review Process Update

Dear Mr. George Strack:

The Federal Transit Administration (FTA) as lead agency, in cooperation with the Chicago Transit Authority (CTA) as a joint lead agency, has been working to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) project. The proposed project would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding.

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

Re: CTA Red Line Extension (RLE) Project Environmental Review Process Update

Dear Mr. John Barrett:

The Federal Transit Administration (FTA) as lead agency, in cooperation with the Chicago Transit Authority (CTA) as a joint lead agency, has been working to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) project. The proposed project would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding.

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

In developing the Draft EIS over the last year, CTA has reached out to a number of participating agencies regarding input on the impact assessment methodologies and the draft technical

analyses in each agency’s area of expertise. As the project moves forward and the Draft EIS is further developed, as a participating agency, you may be asked to review and comment on sections of the document. This will be your opportunity to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, the anticipated impacts and proposed mitigation.

Your agency has previously agreed to be a participating agency for this project. At this time, we would like to reconfirm your involvement as a participating agency and your contact information. If you are not the right contact within your organization, or would like to designate another person for future coordination efforts, please email Sonali Tandon, CTA Project Manager, at STandon@transitchicago.com with the contact’s name, title, and email address. FTA and CTA will use this contact information to provide future updates about the project.

Additional information about the project is available at: transitchicago.com/RedEIS.

Ms. Luann Hamilton
Director, Transportation Planning
City of Chicago Department of Transportation
30 N. LaSalle St.
Suite 500
Chicago, IL 60602

Re: CTA Red Line Extension (RLE) Project Environmental Review Process Update

Dear Ms. Hamilton:

The Federal Transit Administration (FTA) as lead agency, in cooperation with the Chicago Transit Authority (CTA) as a joint lead agency, has been working to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) project. The proposed project would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding.

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

In developing the Draft EIS over the last year, CTA has reached out to a number of participating agencies regarding input on the impact assessment methodologies and the draft technical analyses in each agency's area of expertise. As the project moves forward and the Draft EIS is

further developed, as a participating agency, you may be asked to review and comment on sections of the document. This will be your opportunity to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, the anticipated impacts and proposed mitigation.

Your agency has previously agreed to be a participating agency for this project. At this time, we would like to reconfirm your involvement as a participating agency and your contact information. If you are not the right contact within your organization or would like to designate another person for future coordination efforts, please email me at standon@transitchicago.com with the contact's name, title, and email address. FTA and CTA will use this contact information to provide future updates about the project.

Additional information about the project is available at: transitchicago.com/RedEIS.

If you have any questions, please do not hesitate to contact me. Thank you for your participation on this project.

Sincerely,

Sonali

Dear Mr. Schuessler:

The Federal Transit Administration (FTA) as lead agency, in cooperation with the Chicago Transit Authority (CTA) as a joint lead agency, has been working to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) project. The proposed project would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding.

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

In developing the Draft EIS over the last year, CTA has reached out to a number of participating agencies regarding input on the impact assessment methodologies and the draft technical analyses in each agency's area of expertise. As the project moves forward and the Draft EIS is further developed, as a participating agency, you may be asked to review and comment on

sections of the document. This will be your opportunity to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, the anticipated impacts and proposed mitigation.

Your agency has previously agreed to be a participating agency for this project. At this time, we would like to reconfirm your involvement as a participating agency and your contact information. If you are not the right contact within your organization or would like to designate another person for future coordination efforts, please email me at standon@transitchicago.com with the contact's name, title, and email address. FTA and CTA will use this contact information to provide future updates about the project.

Additional information about the project is available at: transitchicago.com/RedEIS.

If you have any questions, please do not hesitate to contact me. Thank you for your participation on this project.

Sincerely,

Sonali

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. The Draft EIS will also describe other build alternatives that are under consideration, including a rail alternative along Halsted Street, and a bus rapid transit (BRT) alternative along Michigan Avenue, in addition to the No Build Alternative.

In developing the Draft EIS over the last year, CTA has reached out to a number of participating agencies regarding input on the impact assessment methodologies and the draft technical analyses in each agency's area of expertise. As the project moves forward and the Draft EIS is further developed, as a participating agency, you may be asked to review and comment on

sections of the document. This will be your opportunity to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, the anticipated impacts and proposed mitigation.

Your agency has previously agreed to be a participating agency for this project. At this time, we would like to reconfirm your involvement as a participating agency and your contact information. If you are not the right contact within your organization or would like to designate another person for future coordination efforts, please email me at standon@transitchicago.com with the contact’s name, title, and email address. FTA and CTA will use this contact information to provide future updates about the project.

Additional information about the project is available at: transitchicago.com/RedEIS.

If you have any questions, please do not hesitate to contact me. Thank you for your participation on this project.

Sincerely,

Sonali

Re: CTA Red Line Extension (RLE) Project Environmental Review Process Update

Dear Mr. Abraham:

The Federal Transit Administration (FTA) as lead agency, in cooperation with the Chicago Transit Authority (CTA) as a joint lead agency, has been working to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) project. The proposed project would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding.

CTA will be hosting an open house on May 13, 2014 from 5:30 p.m. to 7:30 p.m. at Palmer Park, 201 E. 111th Street, Chicago, IL 60628 to update the community on results of the environmental analysis to date and project progress. Your agency is cordially invited to attend this open house meeting. CTA continues to receive feedback on the project and potential impacts, which will be addressed in the Draft EIS. The meeting format will be an open exchange of information between the attendees and the CTA staff. There will be no formal presentation or testimony.

CTA previously held agency and public scoping meetings in September 2009, and hosted a public open house in August 2011. Since this time, CTA has been preparing the Draft EIS based on analysis of the impacts identified for each of the project alternatives. The Draft EIS is expected to be published for public review in spring 2015. The Draft EIS will document potential benefits and impacts of the Locally Preferred Alternative. This first alternative includes three possibilities: an option running along the existing freight rail tracks of the Union Pacific Railroad (UPRR) right-of-way (ROW Option), in addition to an East Option and a West Option adjacent to the UPRR tracks. Dear Mr. Arkell,

On April 17, 2014, we received a letter from the Regional Administrator, Federal Transit Administration, inviting the Transportation Security Administration (TSA) to attend an open house on May 13, 2014 to receive an update on results of the environmental analysis to date and progress in regards to the red line extension project.

TSA will not be able to participate in this open house, however, we do maintain a compelling interest in all areas related to security and security related risk reduction activities in the design, development, construction and eventual operation of the project. I will serve as your point-of-contact and appreciate the opportunity to partner with you going forward.

Red Line Extension
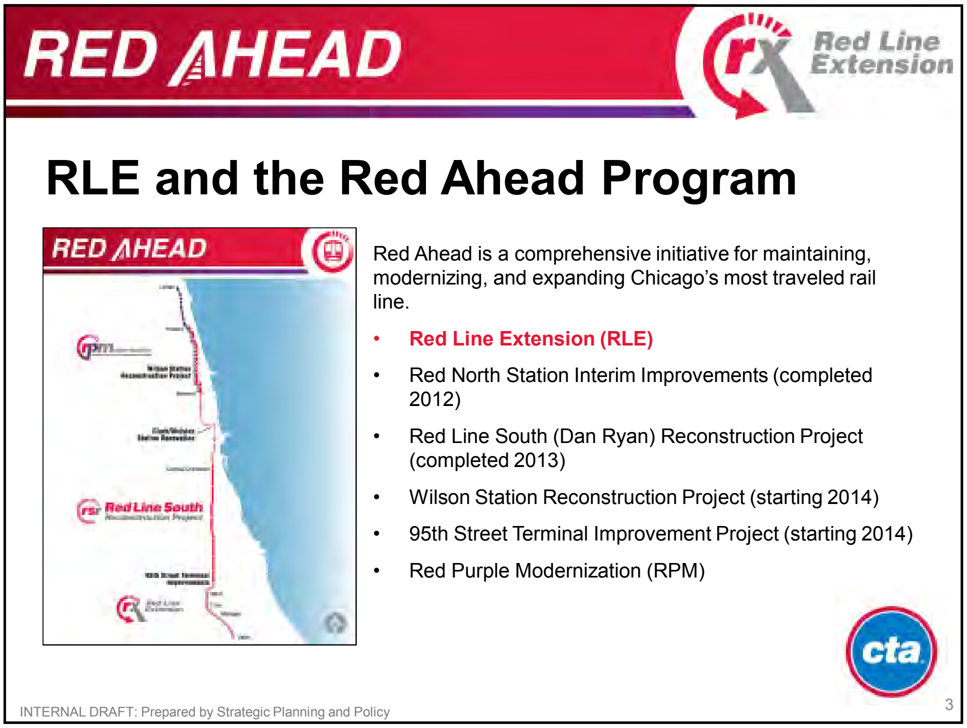
2014

INTERNAL DRAFT: Prepared by Strategic Planning and Policy

RED AHEAD

Red Line Extension

- CTA plans to extend the Red Line 5.3 miles south from 95th Street to 130th Street
- CTA needs public input to move forward on the environmental analysis



RED AHEAD

Red Line Extension

RLE and the Red Ahead Program

Red Ahead is a comprehensive initiative for maintaining, modernizing, and expanding Chicago's most traveled rail line.

- **Red Line Extension (RLE)**
- Red North Station Interim Improvements (completed 2012)
- Red Line South (Dan Ryan) Reconstruction Project (completed 2013)
- Wilson Station Reconstruction Project (starting 2014)
- 95th Street Terminal Improvement Project (starting 2014)
- Red Purple Modernization (RPM)

RED AHEAD

Red Line Extension

CTA is continuing the public processes on two critical components of the Red Ahead Program in 2014

Red Line Extension (RLE)

- Pursuing New Starts federal funds
- New Starts projects expand rail service into an area that is not within the current transit footprint, therefore entail a relatively longer environmental and planning process
- CTA must compete with other New Starts projects from across the country that are already in line for funding
- Multiple alternatives and their impacts are being evaluated

Red and Purple Modernization (RPM)

- Pursuing Core Capacity federal funds
- Core Capacity projects are intended to increase capacity of existing rail lines within the current transit footprint, therefore entail a relatively shorter environmental and planning process
- RPM is the first and only Core Capacity project in the FTA's Project Development phase and is recommended for funding in the proposed FY2015 federal budget
- Phase One includes two main projects and a single alternative is proposed for each of these projects

Project Overview

- The end of the line for the CTA's Red Line South is currently the 95th/Dan Ryan Terminal.
- Later this year construction will begin on the 95th Street Terminal Improvement Project, which will expand and greatly improve the 95th/Dan Ryan Terminal.
- With the estimated $2.3B Red Line Extension (RLE) Project, CTA is proposing to extend service from south of 95th/Dan Ryan Terminal to the vicinity of 130th Street.

Project History and Public Involvement

Alternatives Analysis (2006-2009)

- Project alternatives were presented at six public meetings
- Locally Preferred Alternative adopted by the CTA Board in 2009

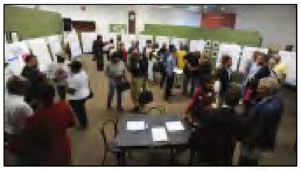
Environmental Scoping (2009)

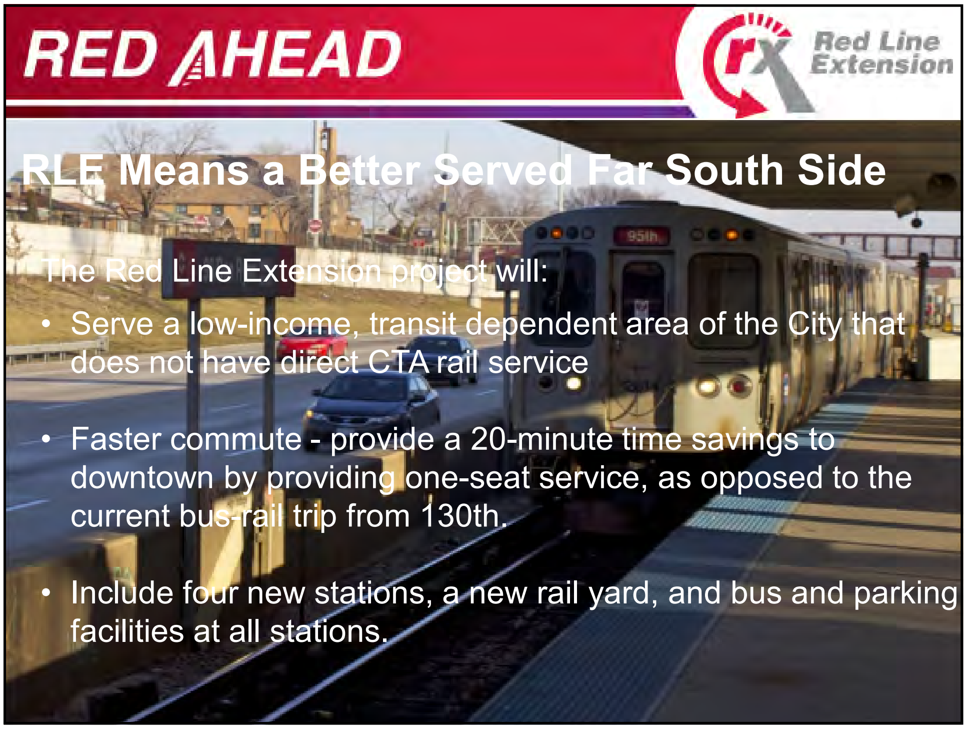
- Community members and public agencies assessed the range of project actions, alternatives and potential environmental impacts

Early Technical Work & Open House (2011)

Draft Environmental Impact Statement (2012 – present)

- Under preparation by CTA and the Federal Transit Administration (FTA)
- Public feedback on the preliminary impact of the alternatives is necessary to complete the Draft EIS





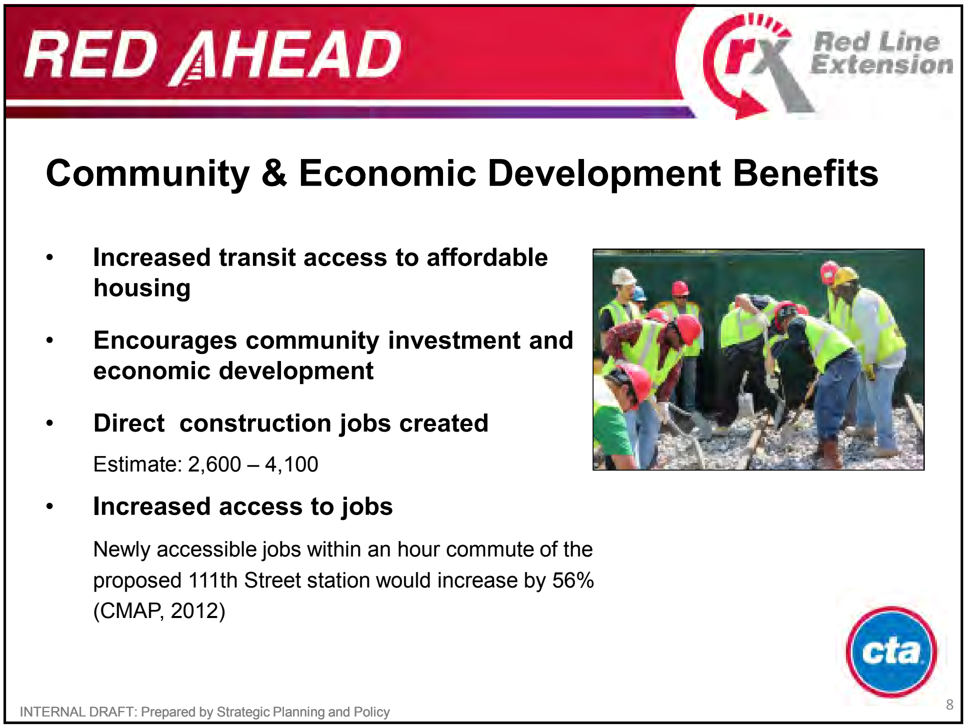
RED AHEAD

Red Line Extension

RLE Means a Better Served Far South Side

The Red Line Extension project will:

- Serve a low-income, transit dependent area of the City that does not have direct CTA rail service
- Faster commute - provide a 20-minute time savings to downtown by providing one-seat service, as opposed to the current bus-rail trip from 130th.
- Include four new stations, a new rail yard, and bus and parking facilities at all stations.



RED AHEAD

Red Line Extension

Community & Economic Development Benefits

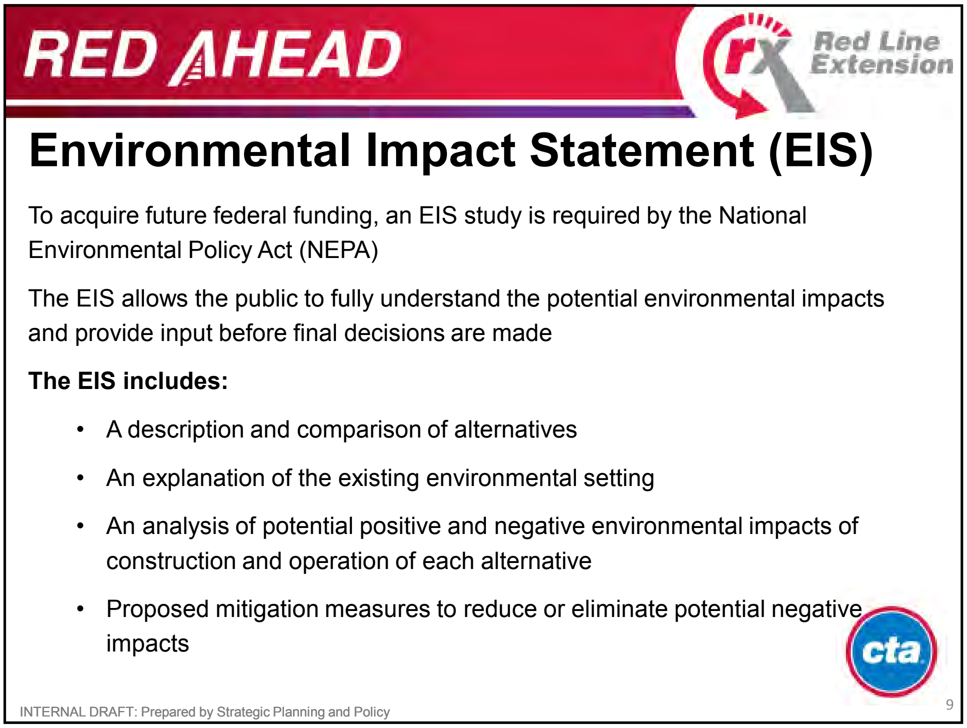
- **Increased transit access to affordable housing**
- **Encourages community investment and economic development**
- **Direct construction jobs created**

  Estimate: 2,600 – 4,100
- **Increased access to jobs**

  Newly accessible jobs within an hour commute of the proposed 111th Street station would increase by 56% (CMAP, 2012)

cta

INTERNAL DRAFT: Prepared by Strategic Planning and Policy



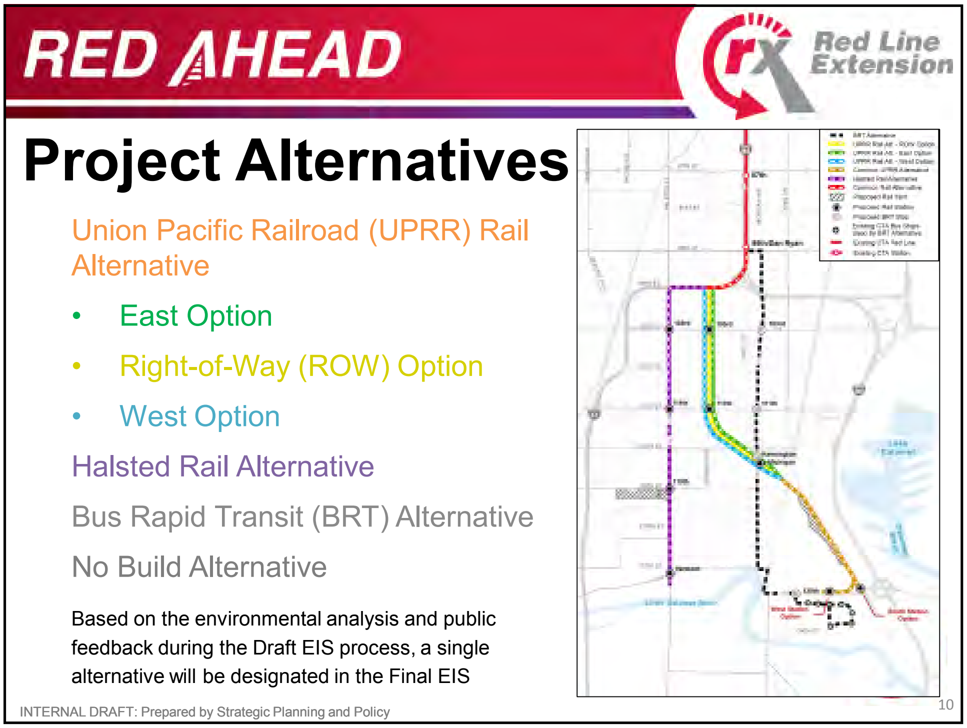
Environmental Impact Statement (EIS)

To acquire future federal funding, an EIS study is required by the National Environmental Policy Act (NEPA)

The EIS allows the public to fully understand the potential environmental impacts and provide input before final decisions are made

The EIS includes:

- A description and comparison of alternatives
- An explanation of the existing environmental setting
- An analysis of potential positive and negative environmental impacts of construction and operation of each alternative
- Proposed mitigation measures to reduce or eliminate potential negative impacts



Project Alternatives

Union Pacific Railroad (UPRR) Rail Alternative

- East Option
- Right-of-Way (ROW) Option
- West Option

Halsted Rail Alternative

Bus Rapid Transit (BRT) Alternative

No Build Alternative

Based on the environmental analysis and public feedback during the Draft EIS process, a single alternative will be designated in the Final EIS

BRT Alternative
UPRR Rail Alt. - ROW Option
UPRR Rail Alt. - East Option
UPRR Rail Alt. - West Option
Common UPRR Alternative
Halsted Rail Alternative
Common Rail Alternative
Proposed Rail Yard
Proposed Rail Station
Proposed BRT Stop
Existing CTA Bus Stops Used By BRT Alternative
Existing CTA Red Line
Existing CTA Station
87th
95th/Dan Ryan
Lake Calumet
West Station Option
South Station Option

UPRR Rail Alternative

Chicago Transit Board Adopted Alternative

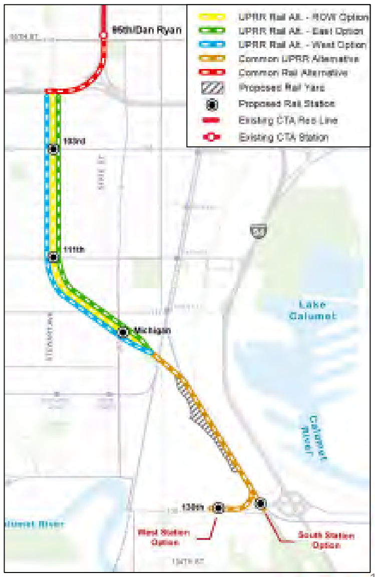
5.3-mile extension along the UPRR tracks

Three options
- East Option
- ROW Option (contingent upon the relocation of UPRR, significant cost and delay TBD)
- West Option

Four stations (103rd, 111th, Michigan, 130th)
- Park & ride facilities (up to 3,700 total parking spaces)
- Bus facilities

Elevated structure from 95th Street Terminal to 119th Street, then at-grade (ground level) tracks from 119th Street to 130th Street

120th Street Yard and Shop



95th/Dan Ryan
103rd
111th
Michigan
130th
West Station Option
South Station Option
Lake Calumet
Calumet River
94
UPRR Rail Alt. - ROW Option
UPRR Rail Alt. - East Option
UPRR Rail Alt. - West Option
Common UPRR Alternative
Common Rail Alternative
Proposed Rail Yard
Proposed Rail Station
Existing CTA Red Line
Existing CTA Station

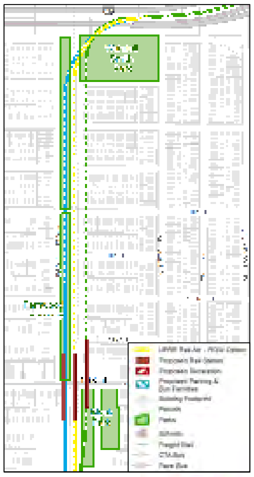
Anticipated Project Impacts

Feedback required from the public on:

- Parks
- Property displacements
- Visual
- Noise
- Community character
- Wetlands
- Historic properties

Parks

Parklands Affected by UPRR Rail Alternative Options			
Parkland	East Option	ROW Option	West Option
Wendell Smith Park	0.4 acres	0.2 acres	0.2 acres
Fernwood Parkway	-	-	1.9 acres
Block Park	0.8 acres	-	-
Total	*1.2 acres*	*0.2 acres*	*2.1 acres*



Mitigation Strategies

Coordination with Chicago Park District is ongoing to identify mitigation including improvements to other parklands or replacement nearby if there are any displacements

Property Displacements

Construction of the project would require the acquisition of private property

Potential Permanent Displacements by Alternative	UPRR			Halsted	BRT
	East Option	ROW Option	West Option		
Affected Parcels without Building Displacements	149	112	144	72	49
Affected Parcels with Building Displacements	110	22	51	38	3
(Residential Building Displacements)	*(95)*	*(17)*	*(30)*	*(17)*	*(1)*
Total Affected Parcels	259	134	195	110	52

Impacts presented are
- based on Conceptual Engineering and represent maximum impacts on all alternatives
- for the purposes of comparing alternatives and will be confirmed in the Final EIS following more detailed conceptual design of the single NEPA preferred alternative

Property Displacements

All major transit construction projects have impacts:

- The Brown Line Expansion had 40 building displacements
- The RPM project (Phase 1) may displace 19 buildings

Mitigation Strategies

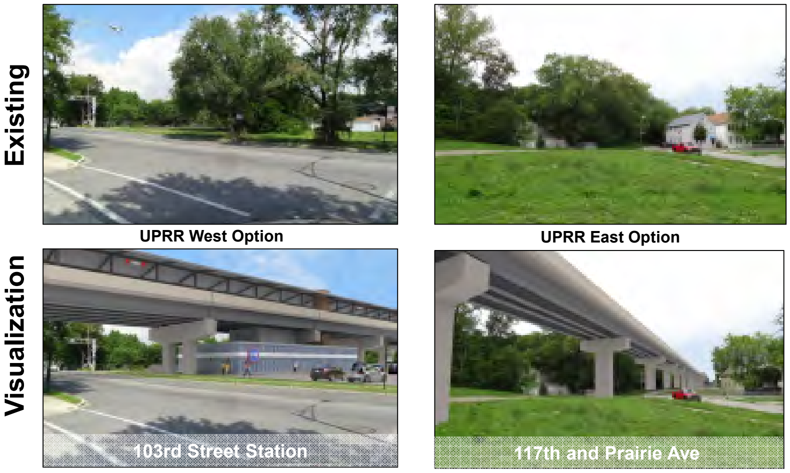
Property owners would be paid not less than fair market value for their land and buildings and may be eligible for compensation equal to the original purchase price of the property. They would also be assisted in relocating their businesses or dwellings, per the Federal Uniform Act on relocation assistance and property acquisition.

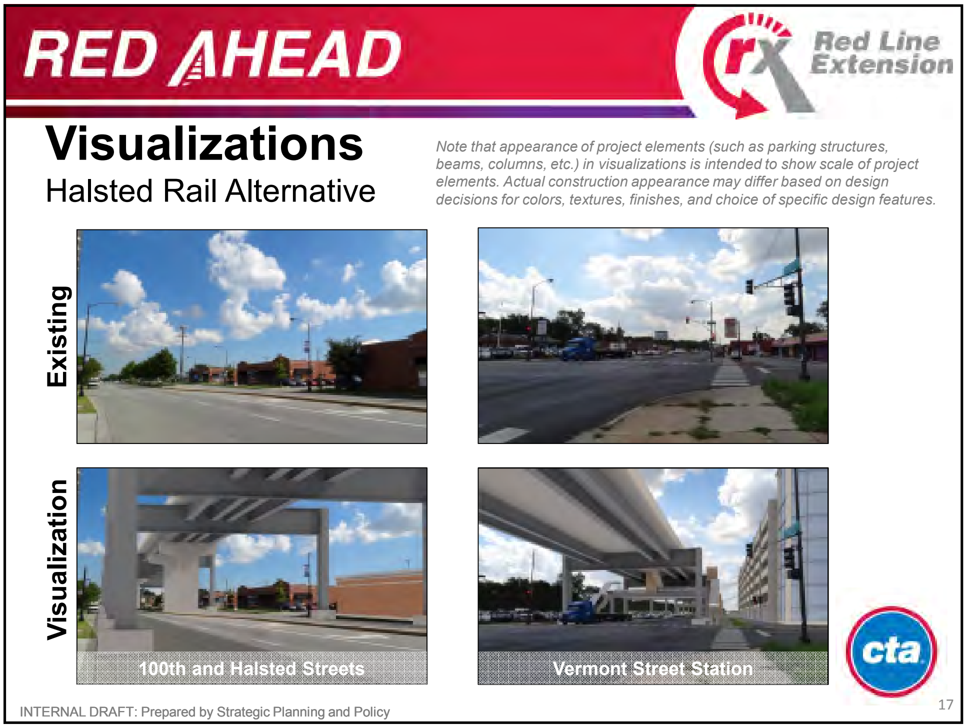
When a single option is chosen, CTA will work with the community and property owners (including the UPRR) to minimize property impacts.

Visualizations

UPRR Rail Alternative

Note that appearance of project elements (such as parking structures, beams, columns, etc.) in visualizations is intended to show scale of project elements. Actual construction appearance may differ based on design decisions for colors, textures, finishes, and choice of specific design features.





RED AHEAD

Red Line Extension

Visualizations

Halsted Rail Alternative

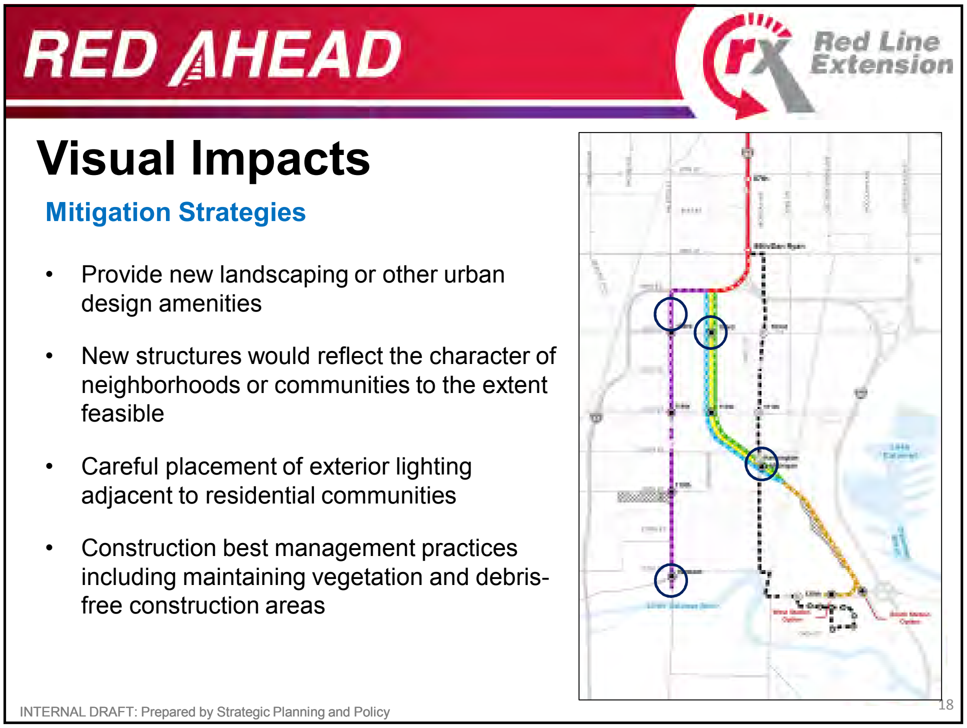
Note that appearance of project elements (such as parking structures, beams, columns, etc.) in visualizations is intended to show scale of project elements. Actual construction appearance may differ based on design decisions for colors, textures, finishes, and choice of specific design features.

Existing

Visualization

100th and Halsted Streets

Vermont Street Station



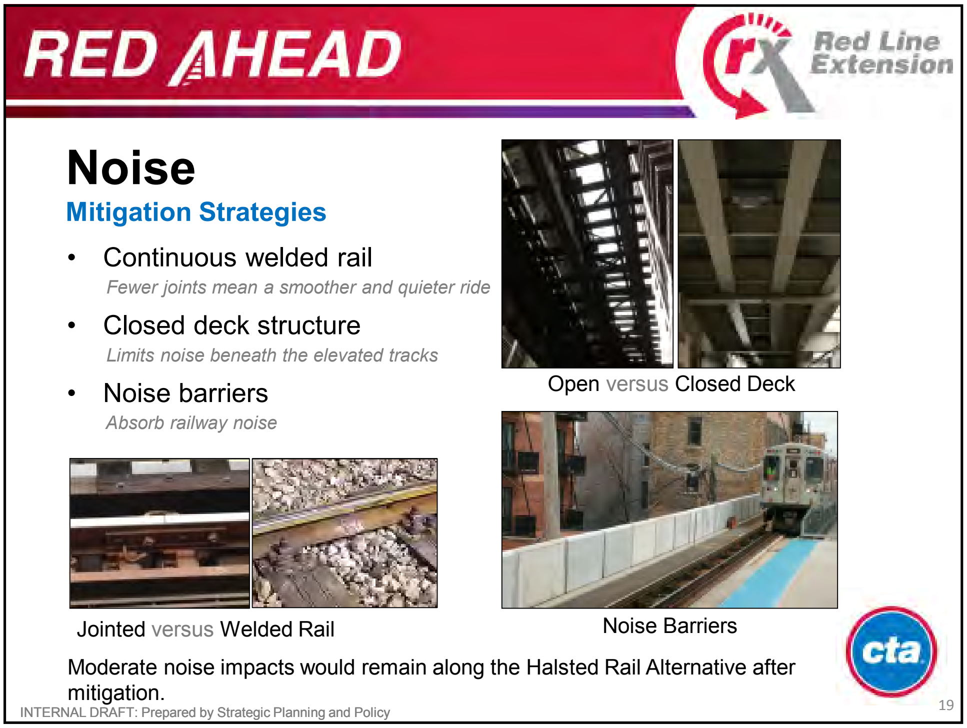
RED AHEAD

Red Line Extension

Visual Impacts

Mitigation Strategies

- Provide new landscaping or other urban design amenities
- New structures would reflect the character of neighborhoods or communities to the extent feasible
- Careful placement of exterior lighting adjacent to residential communities
- Construction best management practices including maintaining vegetation and debris-free construction areas



RED AHEAD
Red Line Extension
cta

Noise

Mitigation Strategies

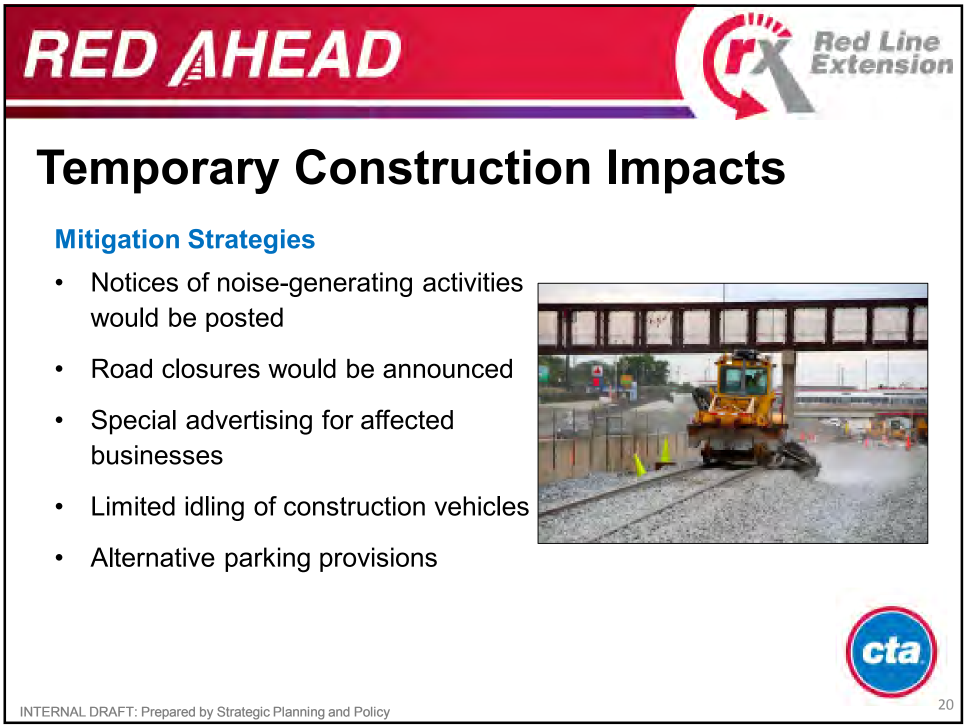
- Continuous welded rail
  Fewer joints mean a smoother and quieter ride
- Closed deck structure
  Limits noise beneath the elevated tracks
- Noise barriers
  Absorb railway noise

Open versus Closed Deck

Jointed versus Welded Rail

Noise Barriers

Moderate noise impacts would remain along the Halsted Rail Alternative after mitigation.

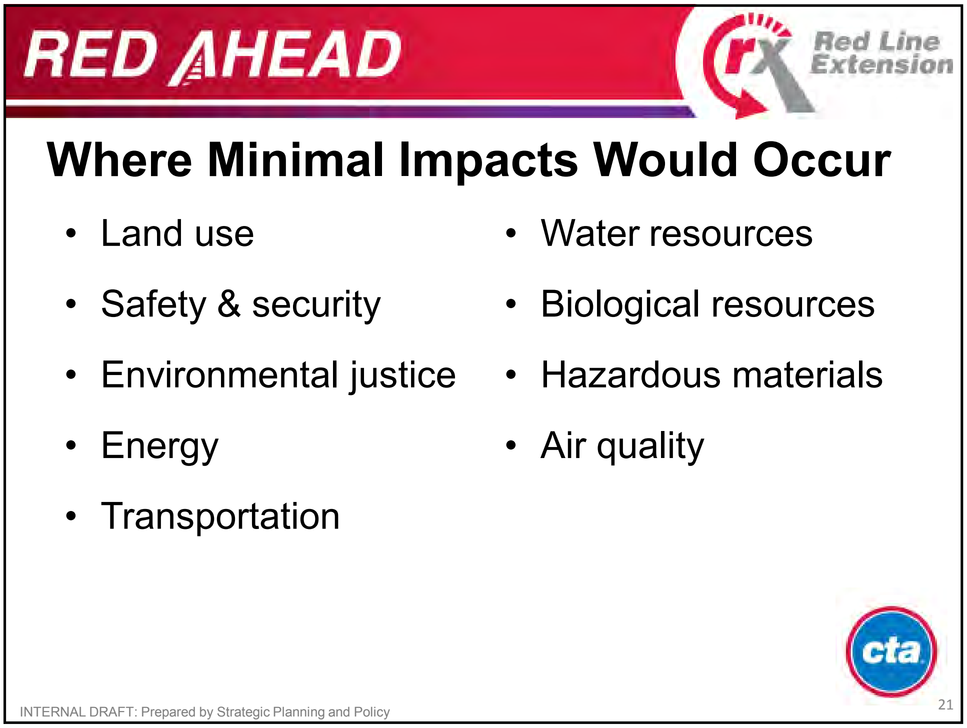


RED AHEAD
Red Line Extension
cta

Temporary Construction Impacts

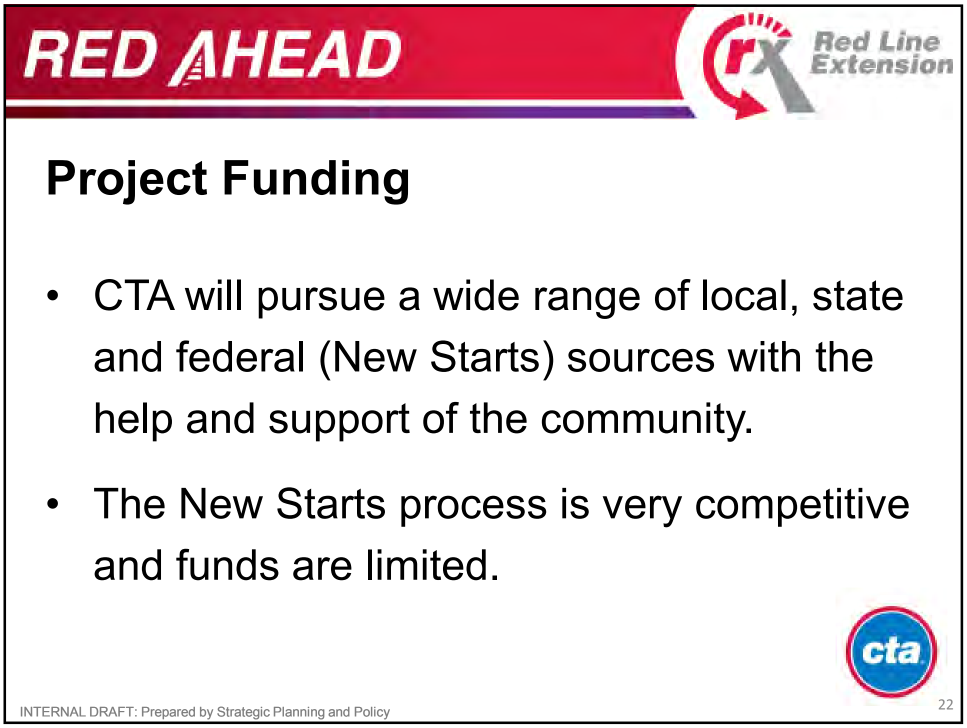
Mitigation Strategies

- Notices of noise-generating activities would be posted
- Road closures would be announced
- Special advertising for affected businesses
- Limited idling of construction vehicles
- Alternative parking provisions



Where Minimal Impacts Would Occur

- Land use
- Safety & security
- Environmental justice
- Energy
- Transportation
- Water resources
- Biological resources
- Hazardous materials
- Air quality



Project Funding

- CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community.
- The New Starts process is very competitive and funds are limited.

Meeting Notes

Date: Tuesday, April 29, 2014

Meeting: CTA with Chicago Neighborhood Initiatives and Greater Roseland Chamber of Commerce

Meeting Purpose: CTA to share RLE Project updates

Present:
Andrea D. Reed, Greater Roseland Chamber of Commerce
Anthony Beckham, Office of Congresswoman Robin Kelly
Jason Swan, Chicago Neighborhood Initiatives
David Doig, Chicago Neighborhood Initiatives
Carole Morey, Chicago Transit Authority
Gerald Nichols, Chicago Transit Authority
Sonali Tandon, Chicago Transit Authority
Melissa Williams (note taker), CWC Transit Group

Time: 10:03 am to 10:52 am

Location: Chicago Neighborhood Initiatives, 1000 E. 111th St., Chicago, IL

Presentation Highlights

CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a bus rapid transit (BRT) alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

Questions and Comments from Meeting Participants

- **Anthony Beckham: An article in the Chicago Sun-Times stated that CTA will receive $2B in funding for this project. How accurate is that statement?**
  Carole Morey: The cost of the project has been estimated at approximately $2.3B. The cost depends on the actual route that will be selected. That estimate is based on the Locally Preferred Alternative which is the UPRR Rail Alternative.

- **Anthony Beckham: Will CTA seek funds from the TIGER grant?**
  Carole Morey: In order for CTA to become eligible for a full funding grant agreement from Federal Transit Administration (FTA), the NEPA process and preliminary engineering have to be completed and local funding has to be committed.

- **Jason Swan: Regarding the UPRR Alternative, it appears that the only viable route is the West Option? Is it possible to acquire part of a particular alternative?**
  Carole Morey: No, a specific option will have to be selected.

- **David Doig: What are the alternative options?**
  Carole Morey: The four alternatives are UPRR Rail Alternative, Halsted Rail Alternative, BRT Alternative, and No Build Alternative.

- **David Doig: What main streets are near the East Option?**
  Sonali Tandon: The East Option is between Wentworth and the Union Pacific railroad.

- **Anthony Beckham: With the line coming from the 130th Street area, has there been any communication with the Altgeld Gardens community?**
  Gerald Nichols: Yes, a meeting was held with the community group. Another meeting is scheduled for the near future.

- **Jason Swan: Will there be employment opportunities for the community during construction phase? One issue that will be posed is that most of the jobs are union. The people from the area are not part of the union.**
  Gerald Nichols: Yes. CTA will make sure that jobs are available to those in the community as it did for the Red Line South project. It is important for the community to be involved with the process because these concerns can be expressed to the unions.

- **Anthony Beckham: What other community groups have been engaged in this process?**
  Gerald Nichols: Developing Communities Project has been involved. CTA will be meeting with the group tomorrow.

- **Jason Swan: What church organizations if any have been engaged in this process?**
  Gerald Nichols: CTA is working on engaging the various community churches. It is CTA's understanding that Developing Communities Project has over 130 churches within its organization.

- **Jason Swan: What is the project construction process? Will the City be the general contractor and have subcontractors bidding on the various scopes?**
  Gerald Nichols: No. There will be a bidding process to select the general contractor. The project bidding process will be similar to that of the Red Line South project.

- **Anthony Beckham: What is the target date for construction?**
  Carole Morey: It is a challenge to put a date in place because there are other items that have to be completed before securing a funding grant agreement from FTA.

  > Jason Swan and Anthony Beckham: CTA should have renderings for all alternative routes displaying before and after visuals. The drawings should also show bus routes and current and potential businesses.
  >
  > Jason Swan: CNI is available to help galvanize community support. It has extensive involvement with the community in building of the local Walmart in the Pullman community.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

Time: 11:23 am to 1:32 pm

Location: Developing Communities Project, 212 E. 95th Street, Chicago, IL

Presentation Highlights

CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at

all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a bus rapid transit (BRT) alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the EIS, a public hearing will be held to share the findings of the EIS.

Questions and Comments from Developing Communities Project (DCP)

- **Rev. J. Leon Thorn: Where will the proposed rail yard will be located?**
  Michael McLaughlin: The yard and maintenance facility will be located at the south end around 120th Street to 127th Street. It is not a residential area and currently has industrial, railroad, and MWRD properties.

- **Phyllis Johnson: What is CMAP? What is the website address?**
  Michael McLaughlin: CMAP is the acronym for the Chicago Metropolitan Agency for Planning (CMAP). In short, the agency integrates planning and land use for the seven counties. The website is www.cmap.illinois.gov
  Sonali Tandon: RLE is the only fiscally constrained extension project in the CMAP 2040 regional plan.

- **Rev. Paul Brown: Is there a time limit on the completion and submission of the EIS? What is CTA's estimated timeframe?**
  Michael McLaughlin: Once CTA enters into the Project Development stage by submitting a letter to FTA, it has two years to complete the EIS. As of now, there is no time limit because the letter has not been submitted to FTA; the Draft EIS has to be completed first. The estimated timeframe is about 3 years to complete the Draft and Final EIS.
  Sonali Tandon: CTA plans to publish the Draft EIS next year. It typically takes 2 years to complete the final EIS with preliminary engineering.

- **Rev. Paul Brown: This project can not move forward until 3 to 5 years from now because the EIS has to be completed?**
  Michael McLaughlin: CTA is working to complete the Draft EIS and has biweekly coordination calls with Federal Transit Administration (FTA) on the project. EIS is FTA's document and requires coordinating with them. Once the environmental work and preliminary engineering (which involves 30% design) is finished, the Final EIS can be completed.

- **Phyllis Johnson: Why does 30% of design have to be completed in order to create the document?**
  Michael McLaughlin: You need to complete about 30% design to complete the Final EIS as some of the information is needed for the Final EIS.

- **Lillie Muhammad: Please clarify the purpose of this meeting.**
  Michael McLaughlin: The purpose of this meeting is two-fold. First, CTA wants to inform the group of items that will be discussed at the public meeting. Secondly, information and feedback from these types of meetings help inform the EIS. CTA has met and will meet with other groups to get feedback.

- **Michael LaFargue: Is money available and budgeted for costs related to the 30% design phase and the creation of the EIS?**
  Deborah L. Truss: Is this cost separate from the estimated project cost of $2.3B?
  Michael McLaughlin: The $2.3B is inclusive of soft costs that include engineering and consultant costs. A budget is being put in place for the extensive cost relative to the preliminary engineering. CTA will seek funding for this process.
  Sonali Tandon: There is prior funding available that will be used for costs associated with drafting the EIS which is planned to be published next year.

- **Deborah L. Truss: Is this project shown on CTA's budget?**
  Michael McLaughlin: DCP has raised this concern previously. The budget writers are taking it into consideration. As of today, the budget does not show projects that are in the planning process. That does not mean that the budget structure cannot be changed.

  > Rev. Paul Brown: Please understand our concern. If these items are not shown, there is a great possibility that this project will be lost over the time period it will take to complete the EIS. The community feels that this project has been set aside while other projects in other communities are constantly being reported on in the newspapers as being completed. If this project is shown as a line item in the budget, it will not get lost. The community does not want to wait another 50 years before this project is done.
  > Deborah L. Truss: CTA will display good faith if the project is shown as a line item even if the amount is $0.
  > Fred Jackson: The project is not as transparent as it should be. The project should be shown as a line item in the budget.

- **Deborah L. Truss: Will the Metra – South Shore or Metra Electric tracks be used for the extension?**
  Michael McLaughlin: The Metra tracks will not be used but will be near the RLE tracks. CTA trains are different from those of Metra.

- **Lillie Muhammad: What parks would be affected? With the replacement of parks, has there been consideration as to where they will be relocated?**
  Michael McLaughlin: Wendell Smith Park, Fernwood Parkway, and Block Park would be affected depending on the alternative and option selected. Parks could be replaced if there are vacant parcels. The West Option will affect Fernwood Parkway and the East Option would impact Wendell Smith Park and Block Park.
  Sonali Tandon: A park would be replaced only if the entire park is affected. If only a small portion would be affected, other mitigation methods will be considered.

- **Rev. Paul Brown: Residents are concerned about displacements and how displacements would affect them as property owners, residents, and those who are leasing. Is there a process in place that assesses fair value and assist them with moving to an area that is conducive to their living?**
  Michael McLaughlin: When the NEPA preferred alternative route has been chosen and the affected parcels have been identified, property owners, renters, and business owners will be assisted in relocating. The Federal Uniform Relocation Act will be followed. If the property value has decreased, the fair value or purchase price could be granted.

- **Godfrey Lawson: Will future potential property value such as the Obama Library or the Chicago port system in the Altgeld Gardens area be factored into assessing property values relative to eminent domain?**
  Rev. Paul Brown: Will the mitigation strategies, relocation process, and means of assessing fair value be itemized in the Draft EIS?
  Michael McLaughlin: The Federal Uniform Relocation Act has to be followed for assessing fair value. This information is not included in the Draft EIS. Pamphlets will be made available at the public meeting regarding the Federal Uniform Relocation Act.

  > Mike Lafarge: Land development and business development coordinators should look into the Uniform Act and do research because there is such a concern for those who are upside down with their mortgage. Also, a challenge has been posed to home owners who have paid their house off 10 to 20 year ago and now would have to relocate to something comparable.

- **Deborah L. Truss: Are there drawings available that show the proposed alternative routes with enough detail to display elevations and properties that would be affected?**
  Michael McLaughlin: Additional information, maps and visuals will be displayed during the public meeting

- **Rev. Paul Brown: How will the public meeting be set up? Will information be gathered through a survey where tabulations can be made? Will there be mailings?**
  Sonali Tandon: There will be no mailings. Information similar to what is being presented today but with more detail will be available at the public meeting. CTA staff will be available to answer specific questions and talk one-on-one. Additional maps and visuals will be available.

  > Deborah L Truss: The PODS which are part of DCP should be the focus group for this project. The group should review the maps prior to being made available to the public. The PODS/DCP can help better prepare CTA for a town hall forum.

- **Lillie Muhammad: Has a strategy been put into place as to how the public will be addressed? Especially those who are affected by this transformation.**
  Michael McLaughlin: Feedback is welcome as the strategy is being formulated. Once the NEPA preferred alternative route is chosen, the affected parcels will be identified. Notification will then be released to affected persons. Relocation options and rights will be explained.

- **Rev. Paul Brown: Will the community have input in choosing the alternative route? What method has been put in place to evaluate the community's opinions?**
  Sonali Tandon: There will be comment cards at the open houses on which community can provide their feedback on alternatives. Results are documented and will be included in the EIS. Once the Draft EIS is published, there will be a formal hearing. A court reporter will be present at that hearing to record public comments. The route will be chosen based on public feedback and technical environmental analysis.

  > Michael LaFargue: A real survey is a cost but can be beneficial. A questionnaire type of survey that can be documented needs to be done and analyzed by a real statistician.

- **Rev. J. Leon Thorn: Has the Halsted Street Route been eliminated?**
  Michael McLaughlin: The statement was misconstrued. The Halsted route has not been eliminated. The board chose the UPRR Rail Alternative as a Locally Preferred Alternative based on public opinion from 2006.

- **Rev. J. Leon Thorn: What is the durability of the system? The community does not want a system that has to be replaced every 20 years.**
  Michael McLaughlin: There are maintenance measures that are put into place so that the structure would not have to be replaced in a short period of time.

- **Deborah L Truss: Is there a benchmark system similar to Chicago's that is used to determine the longevity of this type of structure?**
  Michael McLaughlin: Philadelphia, Boston, and New York are similar in the category of wear and tear in usage.

- **Tiffany D. Hightower: Is there a budget for maintenance and upgrades?**
  Michael McLaughlin: FTA requires a budget for projected maintenance and upgrades in the financial analysis. FTA must be confident in CTA maintaining the structure. FTA considers this type of project as an investment and do not want to waste federal dollars.

- **Rev. J. Leon Thorn: What is the estimated number of people that will be serviced?**
  Michael McLaughlin: That information is being gathered and will be provided at the public meeting.

- **Deborah L Truss: Will the Project Development Process and Next Steps slides be placed on CTA's website?**
  Sonali Tandon: This information will be placed on the website after the public meeting.

- **Fred Jackson: When will the plan be put in place?**
  Michael McLaughlin: It all depends on the local funding. This group's assistance is needed in securing the local match. Once funding is in place, the sooner the project will begin.

- **Rev. Paul Brown: The local PODS are being tapped into by the county commissioner, aldermen, congressmen, and state senators regarding local community projects. The more CTA communicates with these groups, the more information can be relayed to officials.**
  Michael McLaughlin: On April 17th, public officials were briefed about the project. There are more meetings scheduled in the future. CTA will continue communication regarding the project and its efforts.

- **Phyllis Johnson: What is the process in determining historic properties and community characteristics?**
  Michael McLaughlin: Properties that are eligible to be listed on the National Register of Historic Places are deemed historic properties. Community characteristics are addressed by the composition of homes and businesses in the area.

- **Phyllis Johnson: What consideration is taken from the Department of Planning regarding building and developing areas around the alternate routes?**
  Michael McLaughlin: It is a challenge considering options for building and developing areas when the NEPA preferred alternative route has not been chosen.

- **Rev. J. Leon Thorn: Have Park and Ride facilities been addressed?**
  Michael McLaughlin: All four proposed stations will have park and ride facilities with up to 3,700 total parking spaces. The public will decide if they want them.

- **Rev. Paul Brown: The community feels as if there is no sense of urgency with the RLE but other lines are coming up in other communities.**
  Michael McLaughlin: Previous projects that have been completed did not require an EIS.
  Sonali Tandon: This is the first EIS that CTA is preparing.

- **Deborah L Truss: Has FTA given CTA a timeline to finish the EIS? How will businesses be assessed through eminent domain? Especially, strip malls.**
  Michael McLaughlin: CTA will work with the businesses in helping them find a suitable relocation. CTA will also work with the City of Chicago Planning Department for relocation of any strip malls.

- **Tiffany D. Hightower: DCP will support CTA in its efforts if it provides clarity, transparency, and integrity throughout the process. DCP is requesting:**
  1. **Hardcopy of the report that has all of the public comments**
  2. **FAQ from CTA regarding this project**
  3. **Updated timeline which may include "contingent upon funding"**
  4. **A comparison document of completed projects in Chicago which lists things that are needed to get the project completed**
  5. **A comparison of other mega projects in the USA noting timelines and requirements**

  Deborah L Truss: CTA should use the HUD HOME Investment Partnerships Program FAQ as a guideline for creating its own FAQ.
  Michael McLaughlin: DCP should submit a listing of all of its meetings to CTA.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

Date: Tuesday, May 6, 2014

Meeting: CTA with Golden Gate Homeowners Association, People for Community Recovery, and Altgeld Local Advisory Council

Meeting Purpose: CTA to share RLE Project updates

Present:
Gwenda Hoskins, People for Community Recovery
Georgia Curtis, People for Community Recovery
Marguerite Jacobs, People for Community Recovery
Naomi Allen, Altgeld Local Advisory Council
Sharon Davis, Altgeld Local Advisory Council
Doris Martin, Golden Gate Homeowners Association
Cheryl Johnson, People for Community Recovery
Deloris Lucas, Golden Gate Homeowners Association
Regina Scott
Christian Strachan, People for Community Recovery
Kevin O'Malley, Chicago Transit Authority
Gerald Nichols, Chicago Transit Authority
Sonali Tandon, Chicago Transit Authority
Melissa Williams (note taker), CWC Transit Group

Time: 12:41 pm to 1:50 pm

Location: Chicago Youth Center, 951 East 132nd Place, Chicago, IL

Presentation Highlights

CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a Bus Rapid Transit (BRT) Alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

Questions and Comments from Meeting Participants

- **Deloris Lucas: What are the names of the streets associated with the 130th Street Station options?**
  Sonali Tandon: South Station Option – Ellis Avenue; West Station Option – MWRD property.
  Doris Martin: It would be best if the station could be placed in a location where bus routes wouldn't be disturbed, preferably on the side of Altgeld Gardens.

- **Marguerite Jacobs: Have any of the alternatives changed since previous discussions?**
  Sonali Tandon: No, the alternative routes are the same.

- **Marguerite Jacobs: What is the low cost alternative?**
  Sonali Tandon: The Bus Rapid Transit Alternative is the low cost alternative.

- **Georgia Curtis: What parks would be affected if the West Option is selected?**
  Sonali Tandon: Fernwood Parkway and Wendell Smith Park would be affected. Only the jogging area of Wendell Smith Park would be affected.

- **Deloris Curtis: Where are the affected parks located?**
  Sonali Tandon: Block Park is located near the Roseland pumping station; Fernwood Parkway is located between 103rd and 99th Street, next to Eggleston Avenue; Wendell Smith Park is located just south of I-57.

- **Marguerite Jacobs: Will parking be available?**
  Sonali Tandon: Yes, parking would be available at the four designated stations.

- **Gwenda Hoskins: How many homes will be affected along the East Option? A visual should be provided.**
  Sonali Tandon: Approximately 95 residential buildings would be displaced by the East Option.

- **Marguerite Jacobs: Are the homes that will be affected vacant? Will newly built structures be affected? Will CTA pay homeowners for their property?**
  Sonali Tandon: Approximately 95 residential buildings would be displaced by the East Options, which includes vacant homes. The number of vacant homes is not available. CTA is required to follow the Federal Relocation Act - homeowners will be compensated for their property.
  Doris Martin: Most of the buildings along this route are abandoned. There do not appear to be any newly built structures along this path.

- **Cheryl Johnson: Will the project be completed before 2016?**
  Sonali Tandon: The Final EIS and Preliminary Engineering have to be completed and funding has to be secured in order for construction to begin.

- **Cheryl Johnson: Could this project have both public and private funding?**
  Sonali Tandon: That is an option at this time.

- **Christian Strachan: How many people would ride between 130th and 95th Street?**
  Sonali Tandon: There will be approximately 13 million rides annually, both ways, on the new segment.

- **Marguerite Jacobs: Will bus and train fares increase?**
  Gerald Nichols: CTA does not use fares to fund capital projects; this is a capital project.

- **Christian Strachan: How is CTA coordinating with bus routes to avoid long waiting periods?**
  Kevin O'Malley: Logistics will be planned once the route is selected. CTA is too early in the process to work out those details.

- **Cheryl Johnson: What is CTA's preferred route?**
  Sonali Tandon: Based on the community feedback, the CTA Board adopted the UPRR Alternative as the Locally Preferred Alternative.

- **Cheryl Johnson: What can constituents do to voice their opinions? With which political officials have CTA spoken?**
  Gerald Nichols: CTA has briefed Aldermen from the 6th, 8th, 9th, 21st and 34th wards. CTA has also spoken to congressmen. We need the people to come to the public meeting to express their concerns. Comment cards will be available.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

Location: St. John De La Salle, 10205 S. King Drive, Chicago, IL

Presentation Highlights

CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a bus rapid transit (BRT) alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

Questions and Comments from Meeting Participants

- **Arnold Pugh: Would the structure along Halsted Street be elevated?**
  Sonali Tandon: Yes. The tracks would be positioned on elevated structures. Columns would be placed to avoid interfering with traffic lanes.

- **Godfrey Lawson: What types of businesses are located near the proposed Halsted Street structure that would be affected?**
  Arnold Pugh: This route is a positive for business because they would have exposure to more visitors.

- **Vernetta Rucker: Where would parking be located for the surrounding businesses?**
  Sonali Tandon: Street parking would remain available between the columns.

- **Arnold Pugh: Moving forward it would be beneficial to have the addresses of the affected parks.**
  Sonali Tandon: Yes, that will be included in the Draft EIS.

- **Godfrey Lawson: There are plans for economic development on the south side of Chicago. Relative to eminent domain, would future value be considered when acquiring property to build the RLE?**
  Sonali Tandon: CTA is required to follow the Federal Relocation Act when compensating property owners.
  Janet Poole: Property owners might not be at an advantage with fair market value. Owners might be able to yield more from selling the property on their own.

Arnold Pugh: Property owners are concerned that they would not receive the same value in property and community once they have been relocated.

- **Nancy Wimberly: Does the CTA have a list of all addresses of homes and businesses that would be affected? Regarding CTA's Relocation Consultant, Melody Carvajal: What is her job description? What is her salary? What are her credentials? Why isn't her voicemail box set-up?**
  Sonali Tandon: The CTA does not have a relocation consultant for this project because it is still early in the process.
  Nancy Wimberly: CTA should engage someone now to help the community with relocating. Owners need to prepare themselves for losing their homes.
  Sonali Tandon: There are four alternatives that have been presented and one must be selected. Once the preferred alternative has been selected, CTA would contact the property owners to discuss next steps. CTA is trying to be judicious in its communication with the community.

- **Gloria Cosey: When would the route be selected?**
  Sonali Tandon: The Draft EIS is expected to be published in 2015. CTA will then prepare the Final EIS on a single route. The Final EIS is expected to take two years from start to completion.
  Nancy Wimberly: CTA should engage someone now to help the community with relocating. Owners need to prepare themselves for losing their homes.

- **Nancy Wimberly: CTA should release names of all contractors with contract amounts and the demographics of the workforce.**
  Gerald Nichols: This information isn't available for the RLE because construction has not started.
  Godfrey Lawson: This organization will be contacting the black contractors now so that they can be in alignment when the time comes.

- **Janet Poole: Will contractors that have only held $500,000 contracts be afforded opportunities to bid on a $1M+ contract?**
  Gerald Nichols: Yes, CTA engages small contractors in working on its projects.

- **Angela Ware: How far in advance will the RFP be released?**
  Gerald Nichols: Contractors will have ample amount of time to bid. Contractors can go online now and see a listing of all jobs that are available now. It is called JOC.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

Meeting: CTA with Chicago Park District and Friends of the Parks

Meeting Purpose: CTA to share RLE Project Updates and Parks Impacts

Present:
Erika Sellke, Chicago Park District
Cassandra Francis, Friends of the Parks
Sylvia Jones, Friends of the Parks
Sonali Tandon, Chicago Transit Authority
Virginia Jackson, CWC Transit Group
Jenifer Palmer, CWC Transit Group

Time: 1:00 pm to 2:00 pm

Location: CTA Headquarters, 567 West Lake Street, 10th Floor, Chicago, IL

Presentation Highlights
CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and has begun to prepare a Draft EIS which will analyze the potential positive and negative environmental

impacts of construction and operation of each alternative and will propose mitigation measures to reduce or eliminated potential negative impacts. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

- **Parks Impacts**
  CTA has been analyzing the potential impacts of the project from a number of different perspectives, including potential for displacements, noise and vibration, effects on historic properties and others, and will mainly discuss findings with respect to parks in the meeting. Based on the analysis, the No Build, BRT, and Halsted Rail Alternative have no associated potential park impacts. All UPRR Rail Alternative options would impact Wendell Smith Park due to the overlap with the park and elevated structure/vertical clearances. There would be temporary occupancy of a small portion of the park during construction, but the area underneath the elevated structure would remain open after construction. Depending upon the UPRR Alternative option selected, the acreage impacted varies.

  In addition to potential temporary impacts to Wendell Smith Park from all UPRR Alternative options, the UPRR Alternative East Option would impact Block Park. The affected area includes an isolated portion of the park's open space and a communications tower, which is in an area of the park that does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the eastern half of the park. While there would be some temporary construction impacts, no permanent incorporation is needed as the area underneath the elevated track structure would remain open after construction.

  In addition to potential temporary impacts to Wendell Smith Park from all UPRR Alternative options, the UPRR Alternative West Option would impact Fernwood Parkway. The West Option alignment would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets and would affect about 1.9 acres of the park. Temporary closure of the section of the park overlapped by the elevated structure would be necessary during construction. Public use of the park could resume after construction, as long as the area underneath the elevated structure is reopened. However, much of the park between 101st and 103rd Streets would be permanently overlapped and shaded by the structure. Concrete aerial supports would be placed permanently in the park space. The West Option would result in a permanent incorporation of the park space and if this option is selected, CTA would work with the Chicago Park District on appropriate mitigation. Some options have already been discussed with the City, including creating replacement park space nearby and/or adding enhanced recreational features to improve Fernwood Parkway's functionality as a park. The end result would potentially be a net benefit for park users.

Questions and Comments from Meeting Participants

- Discussion followed regarding appropriated funds for project development and Sylvia Jones noted that it was her understanding that $1.5 Billion was to be appropriated in 2009 for the Red Line Extension. CTA stated that funding for the EIS planning study had been received and was used to fund this portion of the project. Once the Final EIS is submitted and a Record of Decision is determined by the Federal Transit Administration (FTA), the project would become eligible under the federally competitive New Starts grant funding. Local and state funding would be needed to secure federal funding.

- Sylvia Jones asked about the future parking fee for the proposed park and ride facility. This has not yet been determined by CTA and would be dependent upon the alternative and option selected to move forward. As the project advances, CTA will further evaluate the size and scale needed for the park and ride facilities.

- CTA asked about any areas of community concern with regard to the potential for park impacts of proposed alternatives. Discussion followed regarding specific parks in the surrounding community. Sylvia Jones asked about impacts to Princeton Park and Trinity Church. Based on review of study area mapping, these facilities are located near 95th Street, east of Eggleston. CTA noted that these areas are outside of the proposed alternatives alignments and study area. Similarly, CTA was asked whether the study reviewed potential impacts to Kensington Park. CTA noted that this had been reviewed but was outside of the area of potential effect.

- Sylvia Jones noted that Carver Park in Altgeld Gardens is a good example park in the area.

- Cassandra Francis asked that Major Taylor Bike Trail be added to the park impacts mapping, as appropriate. Major Taylor Bike Trail is not impacted by the project, but should be shown for reference purposes.

- Discussion followed regarding potential impacts from all UPRR Alternative options on Wendell Smith Park. It is understood that this is not a permanent incorporation and that only a small portion of parkland is affected. However, Ms. Francis noted that leaving the area of overlap between the park and elevated structure afterwards does change the nature of the park use.

- Cassandra Francis had concerns about impacts to parks from the UPRR Alternative options and noted that replacement of parks should be considered as part of the mitigation efforts for Block Park as well as Fernwood Parkway. CTA explained that the portion of Block Park that would be impacted is not used for recreational activity currently and does not contain any amenities. If the UPRR West Option is selected and Fernwood Parkway is impacted, CTA would work with the Chicago Park Department on appropriate mitigation, including creating replacement park area nearby and other amenities.

- Ms. Francis noted that she would like to work with Erika Sellke at the Chicago Park Department to conduct a field visit of the potentially impacted parks and determine ways to enhance compact, integrated park areas within the project study area.

Follow Up

CTA Government and Community Relations staff will provide Ms. Jones with a copy of the Section 106 (Historic) Effects Report.

Friends of the Parks and Chicago Park Department staff will further coordinate a field visit to discuss the potential impacts on parks and appropriate mitigation. CTA offered to coordinate and be part of these field visits if desired.

Friends of the Parks will look for other properties in the area that could be used for parkland mitigation.

Location: Roseland Manor, 11717 S. State Street, Chicago

Presentation Highlights
CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental

impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a bus rapid transit (BRT) alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

Questions and Comments from Meeting Participants

- **How will the best option be determined?**
  Sonali Tandon: CTA is hosting a public Open House in Pullman Park tonight. Based upon the Environmental Analysis and public feedback, CTA will be designating a single alternative in the next step. Your feedback is very important at this point.

- **Are all the alternative options possible at this point?**
  Sonali Tandon: Yes. They are all possible alternatives. The community has shown preference for the option along the Union Pacific Railroad tracks in the past. We are studying all of them currently.

- **Are they going to take a poll? How are they going to determine which option is best?**
  Sonali Tandon: We are doing outreach and getting comments from the public. We'll review those comments from the public. We'll also look at the environmental analysis and impacts of the project. Then, we'll decide on the best alternative based on our analysis and the feedback that we get during this outreach.

- **What is the first stop after 95th Street?**
  Sonali Tandon: 103rd Street is the first stop after 95th Street.

- **There are high schools and houses that have been here for 50 years. What's going to happen?**
  Sonali Tandon: The Union Pacific Railroad tracks are there. We are looking at several options where we can either go to the east or west of the

Union Pacific tracks. We are required to be 50 feet away from the UP tracks for safety considerations which would require some displacements.

- **Mr. Williams: You have been doing this for five years. People are saying that the government does not have the money. How is the community going to get this focused?**
  Sonali Tandon: CTA is currently in the planning phase. We will be pursuing federal and local money for this project. This is a huge project. We estimate the cost to be $2.3 billion. A project of this scale requires intensive planning and time.

- **Mr. Williams: For the money that was just spent on the Red Line, was that used for rehabilitation?**
  Sonali Tandon: That was a very crucial project for CTA because we needed to fix what we already had first before extending. If we build an extension but don't fix the really slow Red Line, then the extension won't work that well.

- **Mr. Williams: How will you get the funding?**
  Sonali Tandon: CTA will be working with the New Starts Program of the federal government that funds such projects. It is very competitive. Different projects from the nation apply for the funding. CTA will be submitting its application for that funding. It only funds up to 50 percent of the project costs. The rest has to come from local and state sources. We will be working with local aldermen and state officials to acquire that funding so that we can apply for federal funding to get the rest of the match.

- **Why won't they extend the line? It would create more jobs.**
  Sonali Tandon: We need to acquire the right-of-way which is why we have all these impacts. We are required to do this study and to identify those impacts. Projects of this scale take time. I understand your concern that it's been on the table for a while.

- **Ms. Harmon: What about the historical value and background of the buildings?**
  Sonali Tandon: As part of the environmental document, we are required to look at historic buildings and if there are any effects on the historic buildings. We are working with the Federal Transit Authority, State Historic Preservation Officer, and local community organizations that specifically work on historic buildings to identify the risk effects. We look at the proposed alignment to see if there are any historic buildings that have already been identified or if there are buildings that could be historic. There is specific guidance on that from the federal government on what could be historic. We then look at the projects effects on those resources. There will be more information at tonight's Open House on historic buildings specifically and historians will be there if you have additional questions.

- **Where is tonight's meeting?**
  Sonali Tandon: The meeting is at Pullman Park. Most of the information provided will be similar to what we presented today. There will be some additional information given and an opportunity to talk one-on-one with CTA staff. If you have more specific questions, we'll have comment cards there for you to provide your feedback.

- **Mr. Thomas: Do you have the land already checked out that you are trying to use?**
  No, we don't have the land currently because we can't go on the railroad right-of-way. We need to acquire properties for the right-of-way.

- **Mr. Thomas: You need permission to do it, right?**
  Sonali Tandon: We need to complete this environmental document first. Then we'll have permission to acquire that land. South of 119th street, there are some old railroad tracks that we may be able to use.

- **Mr. Thomas: You can tie into those railroad tracks?**
  Sonali Tandon: Exactly.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

Meeting: CTA with Far South Community Development Corp.

Meeting Purpose: CTA to share RLE Project updates

Present:
Abraham Lacy, Far South Community Development Corp.
Leroy Chalmers, Far South Community Development Corp.
Eric Thompson, Pullman Bank & Trust
Tina Sanders, Phalanx Family Services
Nikiesha Emery, Far South Community Development Corp.
Gerald Nichols, Chicago Transit Authority
Sonali Tandon, Chicago Transit Authority
Tammi Davis (note taker), CWC Transit Group

Time: 10:08 am to 11:00 am

Location: Kroc Center, 1250 West 119th Street, Chicago

Presentation Highlights
CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a bus rapid transit (BRT) alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the EIS, a public hearing will be held to share the findings of the EIS.

Questions and Comments from Meeting Participants

- **Leroy Jones: How lengthy is the environmental process?**
  Sonali Tandon: We started the environmental analysis in 2012 and are preparing a Draft EIS. We hope to publish it next year. After the Draft EIS is published, we'll have a public hearing to get public feedback and comments. We currently have several alternatives that we are analyzing in the Draft EIS. The Final EIS will present a single alternative with additional engineering, which could take two years for a project of this scale.

- **Abraham Lacy: Relative to the Union Pacific Railroad Alternatives, are all of these alternatives going to be elevated? What conversations have happened relative to proximity to freight trains?**
  Sonali Tandon: The elevated structure, rather than at-grade, is proposed in the median of Halsted Street due to safety implications. For the Union Pacific Railroad, we are looking at an elevated structure from 99th to 119th Street. It would be at-grade (ground) level after that. There are also existing unused tracks that we can potentially use. We have had conversations with UPRR. They would like a 50-foot separation from the tracks because of safety reasons.

- **Abraham Lacy: Would you have to build a new track?**
  Sonali Tandon: We would have to acquire right-of-way and would not be able to use the existing UPRR right-of-way. Acquiring right-of-way means taking some property either east or west of the UPRR tracks. The yellow line shown on the presentation is based on the CDOT study that looked at moving UPRR out of this corridor into a separate area. The ROW Option does not look very feasible at this point because of the significant costs and time delays.

- **Abraham Lacy: Regarding Halsted, you mentioned that it wouldn't be at grade level because of safety concerns.**
  Sonali Tandon: Yes, because of the third (electrified) rail being at street level.

- **Abraham Lacy: I've seen it by the Orange Line, on the other side like on the West side, where you have it at grade level, which is a different type of safety precaution.**
  Sonali Tandon: We always get community concerns on the Yellow Line as there is a safety hazard there. We are not looking at building at grade even though it would be cheaper. There are other technologies like light rail. But the concern with that is that if you have a different type of service then it would not be connected to the Red Line. So people would still need to transfer, which defeats the purpose of the project.

- **Leroy Jones: Where is the proposed yard?**
  Sonali Tandon: With the UPRR Alternative, the yard would be north of 130th Street at the MWRD property. With the Halsted Alternative, we are proposing for the yard to be just south of 119th Street. There is a shopping mall there that would be impacted.

- **Abraham Lacy: At 119th Street, you have intermodal opportunities because it connects to the Metra. It's close to shopping and is a busy corridor.**
  Sonali Tandon: We are here to get your feedback and comments. Most of the comments we've gotten are for the UPRR. There has not been a strong preference from the community for Halsted.

- **Leroy Jones: Most people think that the option is going to be elevated on Halsted. I think that that's what turned a lot of people off because they don't want any type of structure in their neighborhood. I think that if something was presented at grade level to them, then they may say "ok." It might even attract businesses to the area.**
  Sonali Tandon: This would be a modern structure. We have some visuals but they are not the final designs. They are just there to help us see what it could look like.

- **Leroy Jones: What were some of the things that people brought up as to why they preferred the UPRR Alternative as opposed to Halsted?**
  Sonali Tandon: Some people felt that it would be more connected to the community and could connect to Altgeld Gardens, which is the public housing development in that area.

- **Abraham Lacy: Are the impacts only for the Union Pacific Railroad Alternative?**
  Sonali Tandon: No, there are impacts for all alternatives. We are coordinating with the State Historic Preservation Officer and community organizations that concentrate on historic buildings. There are historic

properties along Halsted that would be impacted and historic buildings along UPRR that might be impacted. That has been a big concern that has come out of this EIS process. Currently, we have identified four historic properties which would be impacted but they would not be displaced. I encourage you to go to our website for more information.

- **Abraham Lacy: During conversations with the community, what were some of the comments regarding noise, especially around 103rd Street?**
  Sonali Tandon: That could definitely be a concern and was brought up at the Open House yesterday. We haven't analyzed those comments yet. We have heard concerns about the noise in the past. With the mitigation strategies, our analysis shows that there would not be noise impacts along the UPRR Alternative because of the existing train line. Someone from Green Street did express a concern about the noise at the Open House. Green Street has been identified as a Historic District.

- **Leroy Jones: I understand that there was a recommendation for the CTA and the RTA to coordinate their efforts. Is that something that you're looking at or is the CTA going after the funds by themselves?**
  Sonali Tandon: We are coordinated at every level with RTA. For this project, we will apply for federal funds. To apply for federal funds, we will be in a very good position if are able to identify local funds. The federal government will not even look at our application if we do not have a local funds match. That local match will essentially come from state resources.

- **Leroy Jones: Are bonds being considered for the additional funding?**
  Sonali Tandon: CTA and RTA already have bonds to meet state of good repair needs. We'll be looking at all potential sources. The cost is $2.3 billion and we need at least half of that. One additional point, we have done ridership analysis and modeling for this. The modeling shows that it will be mostly existing bus riders that will benefit from and use the new rail line.

- **Abraham Lacy: What will be the outreach regarding construction jobs for local contractors participating in this project? And is there a certain type of certification that they are supposed to have?**
  Gerald Nichols: We'll do the same thing that we did on the Red Line Reconstruction project. The Chicago Urban League was the filtering house for getting young folks in that neighborhood employed on that project. We'll try to filter all of the young folks or individuals from the community to actually work on the project. We'll provide training beforehand as well. A lot of that is going on at the Urban League right now.

- **Abraham Lacy: Are some of the dollars earmarked to go to business in the community and not some large construction firm in the suburbs?**
  Gerald Nichols: Whoever the contractor is, we'll work with the community to ensure that. We set up meet and greets for local businesses with either the prime or subcontractors.

- **Abraham Lacy: But is there a percentage that will be set aside for construction**
  Gerald Nichols: Yes, we don't call it a set aside but we do have goals just like on Red Line South. Like on the station work, the contractor said he would bid 40%. On the track work, it was 28%. They exceeded that number.

- **Abraham Lacy: Was that a local contractor?**
  Gerald Nichols: That was with DBEs. Yes.

- **Abraham Lacy: Were the DBEs from local communities or statewide?**
  Gerald Nichols: That was with African-American firms.

- **Abraham Lacy: Not just African-American firms but this impacts the East Side as well. Just want to make sure that minority interests are involved.**
  Gerald Nichols: Yes.

- **Abraham Lacy: Are you coordinating your efforts with other prospective projects as well? For instance, a developer is trying to open a store at 115th and Michigan. Are you coordinating with developers in that area?**
  Sonali Tandon: We are working with the City. You mentioned 115th & Michigan; an Aldi's was trying to come there.

- **Abraham Lacy: Yes. Aldi's is there. They moved across the street. So another developer is trying to put a store there.**
  Sonali Tandon: We coordinate with the City of Chicago and whatever plans they have will be shared with us for that project.

- **Abraham Lacy: You work with DCP right? UIC?**
  Gerald Nichols: Yes. They had a separate project with UIC years back. They did something with the Chicago Metropolitan Agency for Planning. Last year, CMAP prepared this video which we showed in our open house yesterday. They are one of the many community organizations with whom we work.

- **Abraham Lacy: I think that 111th and 103rd are going to be heavily impacted. I think the DCP is counting on those stations being at 111th and 103rd. What did the coordination look like on your end as far as keeping up to date with them?**
  Gerald Nichols: We're at the table. They consider themselves a partner with us.

- **Abraham Lacy: I read the article that Ald. Beale put out about Halsted that was in the Sun-Times where it said that it was not going to happen having an elevated track on Halsted, which is understandable. I think it would obscure the business corridor. But I think that if there was a visual showing more of a grade level to show people the potential impact, and then it**

would help financially and with attracting new business to the corridor. I think that should be shown as an alternative as opposed to it just being an elevated track in the middle of a community.

- **Leroy Jones: Why would we not consider light rail assuming that at some point the CTA will eventually have to move to light rail?**
  Sonali Tandon: Light rail is not compatible with the rail system that we have now.

- **Abraham Lacy: What impact will there be on the Metra stations?**
  Sonali Tandon: Metra is a participating agency on this project, which means that we coordinate with them in every step of the process. Metra's market is a different market. People who take CTA are still taking the bus to the CTA and not taking Metra from existing different Metra stations. They want frequent service and access to CTA. It's a different market that Metra is trying to serve than what CTA serves. There is a lot of coordination with Metra and Pace. We had Metra and Pace representatives at our meeting yesterday.

- **Abraham Lacy: Regarding the safety aspect and security, we noticed that at a couple of CTA and Metra stations that they are poorly lit. Has it been discussed as to the level of security and coordination with local police departments to enforce a safer environment, especially with people getting off late from work?**
  Sonali Tandon: In this planning process, we look at safety and security and how that can be improved. It will be a section in the Draft EIS, which will be published next year, as well as in the Final EIS. When we get to the Final EIS, we'll solidify the mitigations, which include additional lighting and cameras. Those are the kind of elements that we are analyzing and proposing for the project in this planning phase. As it moves along to the engineering and future phases, those recommendations will get solidified. So, again, all the feedback that we get from the community is very helpful and insightful because the more you speak, the more it will count.

- **Abraham Lacy: When it comes to the nearby stops, there are abandoned buildings near the right-of-way. The last thing residents want to see coming off a stop is an abandoned house. Are you looking at the surrounding radius? What does that radius look like?**
  Sonali Tandon: We anticipate with the urban design and landscaping features that it will be an attractive stop. It will encourage more community activity and more interest for people to move in rather than move out. We have seen increased development and growth along the Brown Line.

- **Abraham Lacy: How many permanent jobs would be created?**
  Sonali Tandon: We haven't looked at the operations jobs, but there will be some once the project is complete.
  Gerald Nichols: On the Dan Ryan/Red Line, about 775 CTA jobs were created. That doesn't include the construction jobs.

- **Leroy Jones: How long will the actual construction project take?**
  Sonali Tandon: We are planning to publish the draft document in 2015. The final document can take up to two years after that. Everything is dependent upon federal funding and approval. If everything goes great, it may take about five years to build it. Before that, we will have the engineering phase, acquiring the right-of-way, which will take about two to three years prior to the five years.

- **Leroy Jones: So, we're looking at about eight years?**
  Sonali Tandon: Yes.
  Gerald Nichols: That's about average for a brand new railroad being built whether the project is here, Baltimore, or New York. That's about average.

- **Eric Thompson: Does CTA have some type of barometer on how the state feels about the project?**
  Gerald Nichols: The state funded the entire Red Line South Project. The entire $425 million was State money.

- **Eric Thompson: How long did it take to get the money from the state?**
  Gerald Nichols: I don't know.

- **Tina Sanders: What percentage is the state bringing to the table for this project?**
  Sonali Tandon: The maximum that that federal government would provide is 50%, but typically they provide 30%. The other 70% – 50% would be needed from local resources.

- **Eric Thompson: Has there been any indication as to what the state or the city is willing to give as far as financial commitments?**
  Gerald Nichols: This project has to be done, so we'll find the money. It's the only line that doesn't extend to the city limits.

- **Abraham Lacy: Is this coordinated with Olive Harvey and the Mayor's Transportation & Logistics Center, which is opening in the fall of this year?**
  Sonali Tandon: We were not aware of it. Do you have any contact information on it?

- **Leroy Jones: I have it.**
- **Abraham Lacy: The Mayor is definitely pushing that.**
  Sonali Tandon: Ok. Thanks.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

Meeting Notes

Date: Thursday, May 15, 2014

Meeting: CTA with Agape Community Center

Meeting Purpose: CTA to share RLE Project updates

Present:
Benjamin Sutton, Resident
Brad Harry, Agape Community Center
Tonya Easter, Agape Community Center
Marc Henkel, Agape Community Center
Linda Cotton, Agape Community Center
Laverne Horne, BNCO & Roseland Neighborhood Community Organization
Marcus Kellum, Resident
Gerald Nichols, Chicago Transit Authority
Sonali Tandon, Chicago Transit Authority
Tammi Davis (note taker), CWC Transit Group

Time: 10:45 am to 11:37 am

Location: Agape Community Center, 342 West 111th Street, Chicago

Presentation Highlights

CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a bus rapid transit (BRT) alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

Questions and Comments from Meeting Participants

- **Marc Henkel: There was an open house meeting on Tuesday. Is this similar to that meeting or is this completely different? How does this compare to the Tuesday meeting?**
  Sonali Tandon: This is a preview of what we presented at that meeting. We don’t have all the boards that we shared at the meeting; all the boards are available online. Today we’ll provide the big picture of what was shared. We asked people in the community to provide feedback. Today, we are also here to get your feedback. You can also provide your feedback later by mail or email.

- **Linda Cotton: Why wouldn’t CTA use the UPRR tracks?**
  Sonali Tandon: The CTA doesn’t have right-of-way for those tracks. Those tracks are Union Pacific Railroad tracks. It’s their right-of-way. They want us to be 50 feet away from their tracks.

- **Marc Henkel: Is there a projected end date?**
  Sonali Tandon: We have almost completed the analysis internally. We are here to present our findings. After this, we will be coordinating with the Federal Transit Administration because this is their project and document. We will publish the Draft EIS sometime next year.

- **Laverne Horne: And that allows you to pursue funding?**
  Sonali Tandon: Yes. This whole EIS process allows us to pursue funding. But that will be just a Draft EIS. The Final EIS will be prepared on one single alternative. In this Draft EIS, we are evaluating three different alternatives. In the Final EIS there will be just one alternative. Then, we’ll do additional engineering to ensure that whatever impacts we are presenting are accurate. We will also have more negotiations on mitigations with different partners.

- **Laverne Horne: Regarding access to affordable housing, how will the housing be affected?**
  Sonali Tandon: This project will provide increased transit access to affordable housing and general housing stock. By bringing transit to the area, people will be able to utilize transit more.

- **Marc Henkel: Will the RLE be elevated? From where to where?**
  Sonali Tandon: Yes, it will be elevated from 99th Street to 119th Street.

- **Marc Henkel: Do you mean overhead?**
  Sonali Tandon: Yes, overhead. The structure will be like what's on the Orange Line. Some of our structures downtown are older, like 100 years old; this will be a more modern structure.

- **Marc Henkel: Do any of these options include a subway underground?**
  Sonali Tandon: No, subway is very expensive. One example is the 2nd Avenue Subway in New York. CTA is not looking at subway options.

- **Marc Henkel: I see the end of the orange line on the slide. Is the orange one of the alternatives?**
  Sonali Tandon: All of these options will continue on the same segment. It differs just where we are relative to the Union Pacific Railroad.

- **Brad Harry: You say it's elevated, but it's not necessarily elevated over the existing railroad track?**
  Sonali Tandon: No, it won't be elevated over the existing railroad track. It can't be for safety reasons. We have to be 50 feet away from the existing UPRR tracks.

- **Marc Henkel: Are you going to zoom in on these three options?**
  Sonali Tandon: Yes. I have another slide about the UPRR Alternative. The Halsted Alternative would be elevated and in the median of Halsted Street. We have a few visuals here and more are on our website.

- **Marc Henkel: Will this extension only have four stations?**
  Sonali Tandon: Right.

- **Marc Henkel: Will all the Bus Rapid Transit stops be along Michigan Avenue?**
  Sonali Tandon: Yes. Then, the BRT route will run along Michigan Avenue and then it will continue into Altgeld Gardens just like our #34 Bus Route but with BRT elements in it.

- **Marc Henkel: Will there be any traffic impacts? If there's a stop at 111th Street, will traffic be stopped every time?**
  Sonali Tandon: The tracks will be elevated so traffic will not be stopped. People will be trying to access the CTA and also crossing the railroad with

freight trains passing. There could be safety concerns; to mitigate the safety concerns we could put quad-gates, which are basically two gates on each side, and a pedestrian gate to discourage crossing.

- **Brad Harry: Not Fernwood Park but Fernwood Parkway? I don't know where that is.**
  Sonali Tandon: Fernwood Park is separate. There is just green land with some trees at Fernwood Parkway. It's just next to the UPRR right-of-way.

- **Brad Harry: On this slide, you're showing the East Option, Right-of-Way Option, and West Option. But, the ROW Option is not really an option because of the safety concerns. So it's going to be either East or West?**
  Sonali Tandon: The ROW Option assumes that Union Pacific would no longer be in their current right-of-way and that they would move somewhere else. There was a study conducted that looked at moving them.

- **Brad Harry: They said no?**
  Sonali Tandon: It would have unlimited delays and cost implications.

- **Marc Henkel: Have you thought about putting something above them?**
  Sonali Tandon: No, because we would still need to be 50 feet away.

- **Linda Cotton: Would this building be a displacement?**
  Sonali Tandon: What we are evaluating at this stage are not defined engineering plans; we are looking at what could be impacted. As the process proceeds, displacements will be minimized.

- **Linda Cotton: But you have identified 110 properties that could be displaced.**
  Sonali Tandon: Yes.

- **Brad Harry: Trains blow horns because there aren't quad gates that come down. Ald.Carrie Austin says that we can't get money for quad gates because it's a federal thing. But we could have quad gates with this option?**
  Sonali Tandon: Yes. That is one of the mitigation measures that we are looking at because we don't want people crossing freight to get to a CTA train. It would be a safety concern.

- **Brad Harry: Some of these impacts are negative and some are positive?**
  Sonali Tandon: Yes. But the negatives are not adverse. There will be some impact but not to the level that it would be a concern to the community.

- **Laverne Horne: What's the difference between the type of noise that the Metra train that runs through Beverly makes and the type of noise that this track will make?**
  Sonali Tandon: Our findings show that moderate impact will be defined as something people will be concerned about. Our analysis did show that the impacts would be moderate along the Union Pacific after we adopt all those mitigation measures. But in terms of the decibel noise of the Metra trains versus the decibel noise of the CTA trains, I will have to get back to you.

- **Marc Henkel: It seems to me that the CTA has less noise than the Union Pacific but more noise than the Metra. When you're on the North side or downtown and hear the "L", you can definitely know it's there.**
  Sonali Tandon: These structures would be new structures and quieter than some of the structures downtown. As the trains come to the station, the speed really reduces, so there won't be much noise from the trains but will be from the station itself such as, "doors closing" type of announcements. We also have noise maps on the exhibit boards online that designate moderate and severe noise levels. They show at what distance the noise will be moderate and at what distance it will be severe.

- **Marc Henkel: Have you done anything with the safety and security?**
  Sonali Tandon: We are looking at additional lighting and cameras around the stations. That has come up as a concern, so obviously it will be a part of the mitigation. We will work with the City of Chicago and the OEMC to identify who will be maintaining and monitoring those cameras as well as their exact distance. Is that a concern that you have for the station here?

- **Marc Henkel: I don't take the Red Line often. Sometimes when I go by the 95th Street Station, I see additional police officers and there are occasional incidences there. I was wondering if that's going to increase incidences here or at the other stops.**
  Sonali Tandon: Our analysis didn't show that bringing the stations would increase crime, but it is definitely a concern from the community. We will be addressing it in the project design so that the design is more open and includes more lighting and cameras.

- **Marc Henkel: Will there be additional security at the different stations?**
  Sonali Tandon: It is too early to say. We are still in the planning phase. As some of the things get decided and built, we'll see how the community reacts. There will obviously be security.

- **Brad Harry: You need local funding first before you get federal funding?**
  Sonali Tandon: Yes. It is a very competitive process. Different states have different projects that they are funding. The federal government would want to know what local match we have. But there are other criteria including the ridership, cost of the project, how many transit-dependent

people will use it, etc. There are several different criteria that the federal government reviews, but local funding is one of the major items.

- **Brad Harry: Let's say it takes five or ten years to get the funding. How long do you have to wait before you have to do another EIS?**
  Sonali Tandon: An EIS has a short shelf life. We would have to look at the EIS again. At some point, if the wait gets really long, then we'd have to redo the whole EIS. But if it's not that long, then we'd just have to redo some of the work but not all of it.

- **Marc Henkel: What's the soonest that everything will fall into place and things will start getting built – estimated?**
  Sonali Tandon: It all depends on funding and approvals. We currently have funding to finish the Draft EIS. We also need funding to do the Final EIS and the engineering. If we had all the funding and approvals, then the Final EIS could take two to three years. The engineering step could take another two to three years. Then construction would take about five years. So, to clarify, the ten years that I mentioned earlier was when the construction would start and not when it would end.

- **Marc Henkel: So it could take six years before you get funding to start construction?**
  Sonali Tandon: Right, to start construction.

- **Brad Harry: Construction is expected to last about five years?**
  Sonali Tandon: Yes.

- **Brad Harry: Our initial concern is if you choose that East Option, our business would be one of the businesses that would be displaced. To my knowledge, we have not been contacted by CTA. I spoke with residents on the west side of the tracks that stated that they had been contacted by CTA about exploring whether or not they would be willing to sell their property.**
  Sonali Tandon: We have not contacted anyone regarding that. So if someone had been contacted, then that's not from CTA. We just sent postcards to inform people about this meeting. We have not contacted anyone. We have these alternatives. We have not finalized on any of them and have not identified specific properties. The numbers that I have presented are just based on the maximum envelope.

- **Brad Harry: So even after the Final EIS, there's no guarantee that you'll get funding in time to go forward with this.**
  Sonali Tandon: Acquisition will not start until we have the funding and approval from FTA. The EIS gives us approval to start that acquisition, but it doesn't mean that we will start. We'll only start when we have the funding.

- **Brad Harry: Acquisition happens when you receive full funding?**
  Sonali Tandon: Yes.

- **Marc Henkel: Who's the person or entity that will determine which alternatives will be chosen?**
  Sonali Tandon: It would be CTA and FTA, based on the comments we have been getting through the public comment process, and based on our analysis. There are park impacts, historic property impacts, displacements on east versus west, and also further discussions with FTA.

- **Marc Henkel: Would aldermen be involved?**
  Sonali Tandon: We have been briefing aldermen and getting their feedback as well.

- **Brad Harry: We know that CTA has the Alderman's voice in their ear.**
  Gerald Nichols: Some years ago, we came out this way to discuss the West Option. We've spoken with Ald. Carrie Austin. She wants to go back out to the community to see if they still want that option.

- **Marc Henkel: So with the Halsted Alternative available, they still chose the West Option?**
  Gerald Nichols: Yes. We're still going to discuss all of the options to see if their minds have changed. They might want the Halsted Alternative.

- **Marc Henkel: Was there a 25 feet restriction then or was the 50 feet restriction presented at that time?**
  Sonali Tandon: Previously when we presented, it was not at this level of detail. It was a single Union Pacific Railroad option. We didn't discuss East Option versus West Option. This time around, we are discussing it in greater detail with displacements and impacts.

- **Marc Henkel: You mentioned your website a couple of times. What is the exact website where we can access this?**
  Sonali Tandon: transitchicago.com/redeis

- **Linda Cotton: You talked about the West Option. But even then, it sounds like if there is going to be a parking area, that it could be on the east side and that's the whole issue/area surrounding safety. So, could that be an impact and would it be an impact no matter what?**
  Sonali Tandon: It could be. But we are trying to identify vacant parcels for parking locations because it's more flexible. Second, we are also looking at if it's on that side and the parking is also on that side, then people would not have to cross as much. But some people who live on the East side will have to cross if they parked there. There will be more in-depth studies on the traffic movement. We've already coordinated with CDOT, IDOT, and Cook County on the traffic studies and impacts. There will be more studies conducted.

- **Brad Harry: If the East Option is chosen and this building is demolished for the project or if the West Option is chosen and this building is demolished for the project, it would be a great loss to this neighborhood. We've been here 35 years servicing the neighborhood and the city. I think the neighborhood would feel the loss of the Agape Community Center.**

- **Marc Henkel: Could there be something in the plan where the building can be relocated?**
  Sonali Tandon: In the EIS, we are also looking at community facilities that could be impacted. We would look at the potential locations for them to be relocated. We would be paying the owners the fair market value and help with relocation and costs of relocation. There are a lot of vacant parcels within the community so it should be possible to relocate them within the community.

- **Brad Harry: Great.**
  Sonali Tandon: Any other comments or questions?
  Gerald Nichols: You can also go online and put comments in there. We'll still take them.

- **Marc Henkel: Is that last slide on the website?**
  Sonali Tandon: We have this on the website.

- **Marc Henkel: Is the whole slideshow on the website?**
  Sonali Tandon: It's not exactly this slideshow. This slide is on the website. But it has additional information than what was presented today. It's called Boards. So look for Boards from the open house.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

Meeting Notes

Date: Thursday, June 19, 2014

Meeting: CTA with Alderman Carrie M. Austin and 34th Ward Residents

Meeting Purpose: CTA to share RLE Project updates

Present:
Alderman Carrie M. Austin
Reverend Leonardo Gilbert
34th Ward Residents
Gerald Nichols, Chicago Transit Authority
Carole Morey, Chicago Transit Authority
Melissa Williams (note taker), CWC Transit Group

Time: 6:07 pm to 7:13 pm

Location: Sheldon Heights Church of Christ, 11325 S. Halsted Street, Chicago

Presentation Highlights

CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served far south side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by adding construction jobs and increasing access to jobs.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and is preparing a Draft EIS, which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to minimize potential negative impacts.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West

Option. CTA is also evaluating a rail alternative along Halsted Street, a bus rapid transit (BRT) alternative along Michigan Avenue, and the No Build Alternative. Potential project impacts include impacts to parks, property displacements, visual impacts, noise impacts, community character, wetlands, and historic properties.

- **Funding and Next Steps**
  The CTA will pursue a wide range of local, state and federal (New Starts) sources with the help and support of the community. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

Questions and Comments from Meeting Participants

- **34th Ward Resident: What part of Halsted Street would be affected?**
  Carole Morey: Halsted Street would be impacted from the I-57 alignment around 99th Street on Halsted Street down to Vermont Avenue.

- **34th Ward Resident: How many parcels would be affected along Halsted Street?**
  Carole Morey: The Halsted Alternative would impact 38 total parcels. A total of 17 are homes and the remaining 21 would be commercial and industrial properties.

- **34th Ward Resident: How many streets with homes from east and west of Halsted Street would be affected?**
  Carole Morey: The structure would be elevated; therefore only parcels that are along Halsted Street would be affected. This land would be used for parking.

- **34th Ward Resident: Would the remaining properties on Halsted Street be facing the train tracks as they do along Lake Street?**
  Carole Morey: Yes.

- **34th Ward Resident: Can a portion of the Union Pacific Right-of-Way be taken?**
  Carole Morey: The Union Pacific Railroad evaluated potentially relocating but based on a study they will not be relocating. Therefore, we were left with the East and West Options.

- **34th Ward Resident: Does the Union Pacific Railroad Alternative require taking more homes?**
  Carole Morey: Yes, this alternative has the most displaced homes.

- **34th Ward Resident: What about the Michigan Avenue Bus Rapid Transit Alternative? Would you have to widen Michigan Avenue and take more properties?**
  Carole Morey: No we would not need to widen Michigan Avenue.

- **34th Ward Resident: Is the number of affected parcels based on occupied or vacant properties?**
  Carole Morey: The count includes both occupied and vacant properties. When we go back out to survey the land we would determine how many people would be displaced since that is important.

- **34th Ward Resident: Regarding noise mitigation, would considerations be taken similar to O'Hare?**
  Carol Morey: CTA is required to meet FTA's minimal noise level. CTA would try to minimize noise by using a specific type of structure. If that does not meet the requirement, then CTA may assist residents with getting the proper home insulation.

- **34th Ward Resident: Can the community impose a quiet zone; would CTA assist the community in getting it?**
  Carol Morey: I don't know the answer to that question.

- **34th Ward Resident: Would structure be at street level? Would traffic be affected?**
  Carol Morey: The structure would be elevated. Traffic would not be affected because the train would run above the street.

- **34th Ward Resident: Would there be parking available at the stations?**
  Carole Morey: Yes there would be park and rides available at the stations totaling around 3,100 parking spot.

- **34th Ward Resident: How many homes would be affected along 111th Street because of the park and ride? The main concern is safety. There could be an increase in break-ins.**
  Carole Morey: Please place all your concerns on the comment cards. We will take it into consideration.

- **34th Ward Resident: To avoid homes and businesses being affected, why the train can't go down I-57?**
  Carole Morey: The route has to go through the community in order to have a positive economic impact.

- **34th Ward Resident: Look at how long the train has been going through Englewood with no economic impacts.**
  Carole Morey: We are noting the concern.

- **34th Ward Resident: What types of business would come into the area because of the RLE Project?**
  Alderman Austin: Small businesses are encouraged to come to the area. I would rather see a multitude of smaller businesses rather than a big box business. This would be great for us to create business.

- **34th Ward Resident: Would the Halsted Alternative and the East/West Options be the only options?**
  Carole Morey: So far they are our primary options. If you feel like there is an alternative we are not considering, I encourage you to fill out a comment card.

- **34th Ward Resident: Has CTA considered placing the line down the Bishop Ford?**
  Carole Morey: In order to have an economic impact, it has to be brought through the community.

- **34th Ward Resident: Time Frame – When would an alternative be chosen?**
  Carole Morey: Hopefully in 2015. Further engineering would have to take place.

- **34th Ward Resident: How would the alternative be chosen?**
  Carole Morey: After the FTA approves the document to be published, CTA has 30 days in which people can comment through a public hearing.

- **34th Ward Resident: Would there be permanent jobs with CTA? How many jobs overall?**
  Carole Morey: There would be 2,600 to 4,600 construction jobs and there would be permanent jobs with CTA.
  Gerald Nichols: CTA is currently hiring. Please visit www.transitchicago.com

- **34th Ward Resident: Would federal and private funding be able to cover the project?**
  Carole Morey: Federal and private funding won't cover the entire cost of the project. State funding is also needed.

- **34th Ward Resident: How would the private consumers be affected? Would bus fares increase?**
  Carole Morey: CTA does not use fares to fund capital projects; this is a capital project.

Follow Up

CTA will keep communication lines open and consider issues discussed during this meeting in the upcoming Draft EIS.

RED AHEAD

Red Line Extension:
Expanding Transit Access on Chicago's Far South Side

The Chicago Transit Authority (CTA) is proposing to add major new transit service on Chicago's South Side by extending its busiest rail line, the Red Line, south from the 95th Street Terminal to the vicinity of 130th Street. The proposed 5.3-mile extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue/116th Street, and 130th Street – each new station would include bus and parking facilities. CTA is evaluating the environmental impacts of three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. A rail alternative along Halsted Street and a bus rapid transit (BRT) alternative along Michigan Avenue are also under evaluation.

Why is the Red Line Extension Project important?

- ***Expanded access and service improvements*** – The Red Line Extension would improve service and transit accessibility for Far South Side neighborhoods where transit-dependent residents currently lack direct access to rail service.
- ***Reduced commute times*** – Between 2005 and 2010, commute times were, on average, 20 percent longer for those that currently live in the area that would be served by the Red Line Extension, than for other commuters in the Chicago region. The Red Line Extension would save the average commuter in the communities affected by this project 87 hours per year.
- ***Catalyst for economic growth*** – CTA estimates between 2,600 and 4,100 jobs would be created during Red Line Extension construction. In addition, new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.
- ***Enhanced livability*** – The improvements would also provide linkages to affordable housing, jobs, services, and educational opportunities – enhancing livability and neighborhood vitality.

RED AHEAD

Red Line Extension

Red Line Extension: Project Update

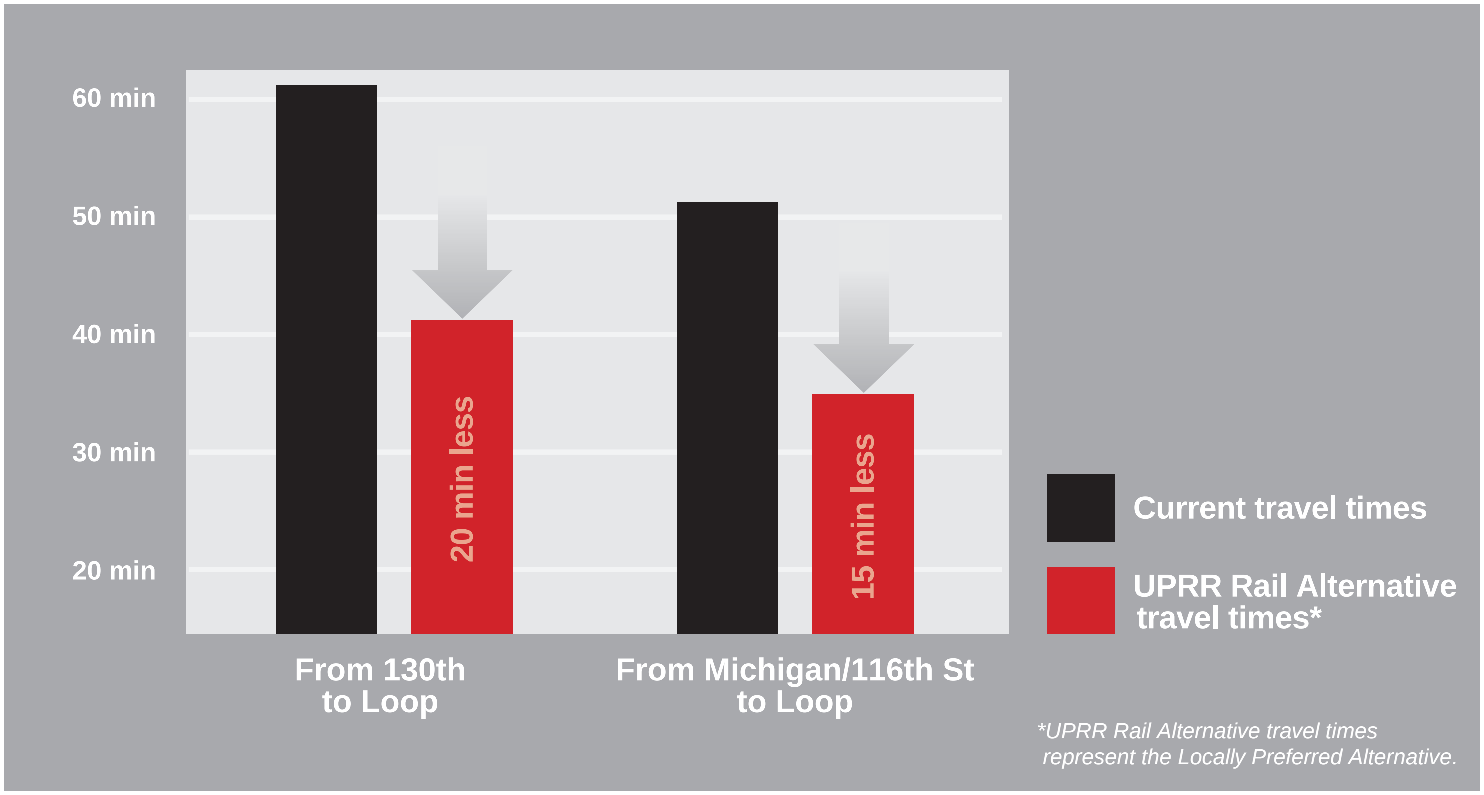
CTA is progressing on what is a multi-step federal process to secure project approval and funding. CTA has been conducting the technical environmental analysis of the project alternatives, and is preparing a Draft Environmental Impact Statement (EIS), expected to be published in early 2015. The Draft EIS will describe each alternative, explain the existing environmental setting and community context for the proposed route, and review potential positive/negative effects of construction and operation.

Following approval of the EIS, CTA can apply to the Federal Transit Administration (FTA) for entry into the Engineering Phase of this project and pursue federal funding under the competitive federal "New Starts" program. There will be future opportunities for public input as this process progresses.

Red Ahead

The Red Line Extension is part of the CTA's Red Ahead program, a comprehensive initiative for maintaining, modernizing, and expanding Chicago's most-traveled rail line. The Red Ahead program also includes the Red Line South Reconstruction Project (completed 2013), the 95th Street Terminal Project (beginning in summer 2014), the Wilson Station Reconstruction Project (beginning in fall 2014), and the Red and Purple Modernization program (currently in planning).

Estimated Travel Time Savings



**UPRR Rail Alternative travel times represent the Locally Preferred Alternative.*

BUILDING A NEW CHICAGO

cta

RED AHEAD

Red Line Extension

Extensión de la Línea Roja: Extender el acceso al tránsito hasta el lado del sur lejano de Chicago

La Chicago Transit Authority (CTA) se propone agregar nuevo servicio mayor de tránsito al lado del sur de Chicago al extender la línea ferroviaria más transitada, la Línea Roja, hasta el sur desde la Terminal de la calle 95 Street hasta las proximidades de la calle 130. La extensión propuesta de 5.3 millas incluiría cuatro nuevas estaciones cerca de las calles 103, y 111, la avenida Michigan/calle 116, y la calle 130 – cada nueva estación incluiría instalaciones para autobuses y estacionamiento. La CTA está en vías de evaluar los efectos ambientales de tres opciones para la Alternativa Localmente Preferida a lo largo de la red ferroviaria de la Compañía de Ferrocarril Union Pacific ("UPRR", por sus siglas en inglés), lo cual incluiría una opción dentro de la servidumbre de cargo existente ("Opción ROW", por sus siglas en inglés), una Opción del Este, y una Opción del Oeste. Está considerándose también una alternativa ferroviaria por Halsted Street y una alternativa de tránsito rápido en autobús ("BRT", por sus siglas en inglés) a lo largo de la avenida Michigan.

¿Por qué es el Proyecto de Extensión de la Línea Roja importante?

- ***Acceso ampliado y mejoras en el servicio*** – La Extensión de la Línea Roja mejoraría el servicio y la accesibilidad al tránsito para los vecindarios del lado del sur lejano donde los residentes que dependen del tránsito actualmente carecen de acceso directo al servicio ferroviario.
- ***Tiempos reducidos del desplazamiento al trabajo*** – Entre 2005 y 2010, el tiempo del desplazamiento al trabajo eran, en promedio, 20 por ciento más largo para las personas que actualmente viven en el área a que brindaría servicio la Extensión de la Línea Roja que para los otros viajeros en la región de Chicago. La Extensión de la Línea Roja ahorraría al viajero pro medio en las comunidades a quienes beneficiaría este proyecto 87 horas por año.
- ***Catalizador para el crecimiento económico*** – La CTA calcula que se crearían entre 2,600 y 4,100 trabajos durante la construcción de la Extensión de la Línea Roja. Además, las nuevas estaciones pueden servir de catalizador para la revitalización de vecindarios y ayudaría a revertir décadas de desinversión en los distritos comerciales locales.
- ***Habitabilidad aumentada*** – Las mejoras también brindarán enlaces a la viviend asequible, trabajos, servicios, y oportunidades educativas – con el fin de potenciar la habitabilidad y la vitalidad de los vecindarios.

RED AHEAD

Red Line Extension

Extensión de la Línea Roja: Últimas noticias sobre el Proyecto

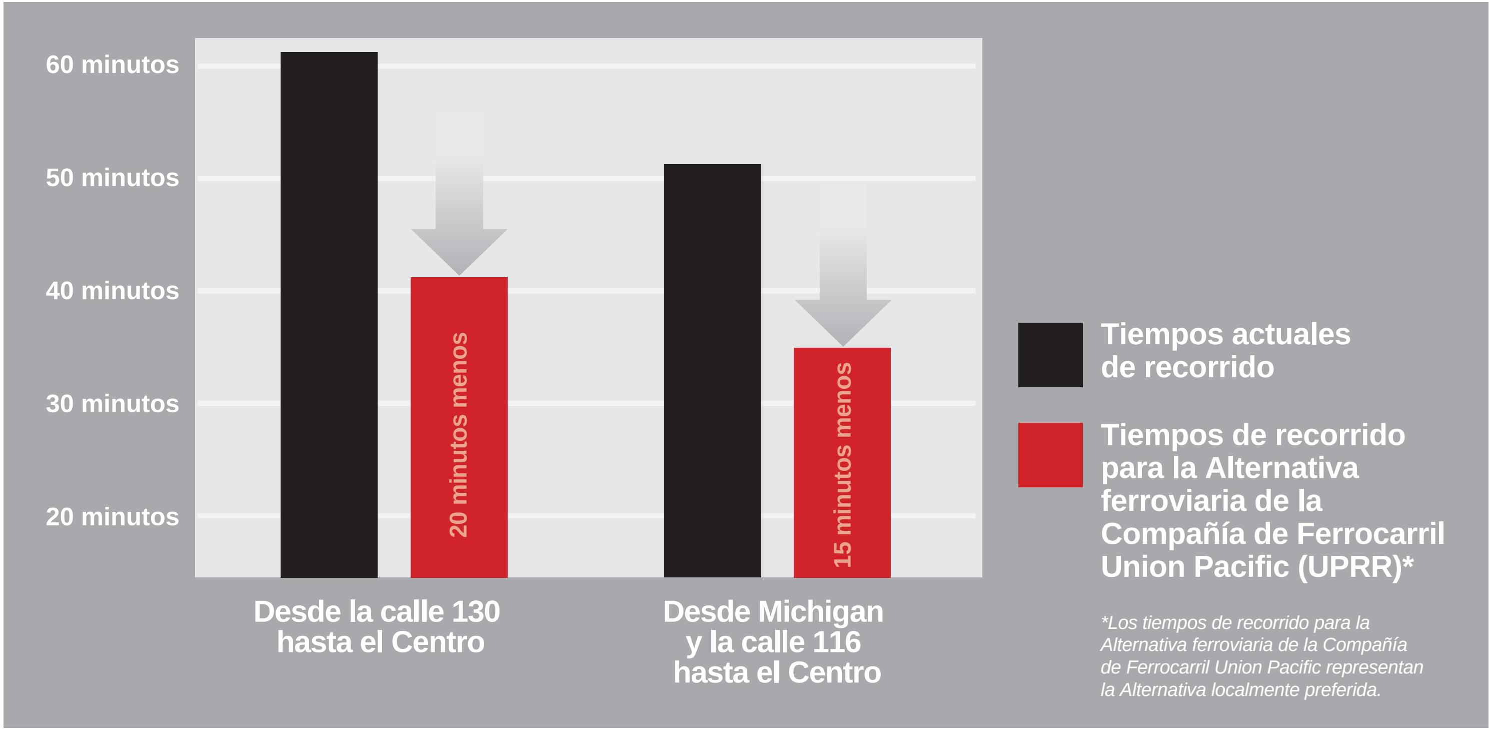
La CTA está progresando en lo que es un proceso federal de múltiples etapas para conseguir la aprobación y el financiamiento para el proyecto. La CTA está en vías de llevar un análisis ambiental técnico de las alternativas del proyecto y está elaborando una Declaración de los Efectos Ambientales en borrador ("EIS", por sus siglas en inglés), la cual se espera que sea publicada a principios del 2015. La Declaración de Efectos Ambientales (EIS) en borrador describiría cada alternativa, explicaría el marco ambiental existente y el contexto comunitario para la ruta propuesta, y repasaría los efectos positivos/negativos potenciales de las obras y las operaciones.

A partir de la aprobación de la Declaración de Efectos Ambientales (EIS), la CTA puede solicitar a la Federal Transit Administration ("FTA", por sus siglas en inglés) permiso para entrar en la Fase de Ingeniería de este proyecto y perseguiría el financiamiento federal bajo un programa federal competitivo llamado "Nuevos Comienzos". Habrá oportunidades futuras para las aportaciones por parte del público a medida que va progresando este proceso.

El Programa Red Ahead

La Extensión de la Línea Roja forma parte del Programa de Red Ahead de la CTA, una iniciativa global para el mantenimiento, la modernización y la extensión de la línea ferroviaria más transitada de Chicago. El programa de Red Ahead también incluye el Proyecto de Reconstrucción de la Línea Roja al Sur (terminado en 2013), el Proyecto de la Terminal de 95th Street (de próximo inicio en el verano de 2014), el Proyecto de Reconstrucción de la Estación de Wilson (de próximo inicio en el otoño de 2014), y el Programa de Modernización de las Líneas Roja y Púrpura (actualmente en etapa de planificación)

Ahorro aproximado de los tiempos de recorrido



**Los tiempos de recorrido para la Alternativa ferroviaria de la Compañía de Ferrocarril Union Pacific representan la Alternativa localmente preferida.*

BUILDING A NEW CHICAGO

cta

Glossary of Terms

The following are definitions of terms used as part of the Environmental Impact Statement process.

Affected Environment: The physical, biological, social, and economic setting potentially affected by one or more of the alternatives under consideration.

Alternative: One of a number of specific transportation improvement proposals or options.

Bus Rapid Transit (BRT): BRT is a bus service which provides faster, more efficient, and more reliable service than an ordinary bus line. Often this is achieved by making improvements to existing street and traffic infrastructure. Typically high-capacity, uniquely-identified buses are used.

Chicago Department of Transportation (CDOT): CDOT is the City of Chicago agency responsible for transportation.

Chicago Metropolitan Agency for Planning (CMAP): The planning organization for the Chicago region. CMAP has prepared the GO TO 2040 comprehensive regional plan that provides strategies for the regional transportation network.

Chicago Transit Authority (CTA): The CTA is an independent governmental agency created by state legislation. It operates the nation's second largest public transportation system and covers the City of Chicago and 35 surrounding suburbs. CTA is the local lead agency on the RLE Project.

Core Capacity: A new federal program to fund substantial improvements to existing transit lines that are currently (or expected to be in the next five years) at or over capacity. This means that trains and/or stations are overcrowded and additional service cannot be added without the proposed improvements. To be eligible, these projects must increase passenger carrying capacity by at least 10 percent.

Cumulative Impact: The incremental environmental impact or effect of the project when added to the impacts of other separate past, present, and reasonably foreseeable future actions.

Environmental Impact Statement (EIS): An EIS is a document that evaluates the economic, social, and environmental effects of a major proposed project. The National Environmental Policy Act (NEPA) requires an EIS to be prepared when federal funds are being sought to fund all or part of a project.

Environmental Justice: Environmental Justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to transportation planning and decision-making processes, per Executive Order 12898.

Federal Transit Administration (FTA): The FTA is a division of the U.S. Department of Transportation that funds transit planning and programs. FTA is the federal lead agency on the RLE Project.

Impact: An impact is a change in the condition or function of an environmental resource that occurs as a result of the proposed alternative. An impact can be adverse (negative) or beneficial (positive), permanent or temporary.

Lead Agency: The agency or agencies responsible for preparing the EIS in compliance with the NEPA. The FTA and CTA are the lead agencies for the RLE Project.

Locally Preferred Alternative (LPA): The Union Pacific Railroad (UPRR) Rail Alternative was selected by the Chicago Transit Board as the LPA in August 2009, indicating that it is the alternative that best meets the purpose and need of the project while addressing potential impacts and other potential constraints

Mitigation: Action or measure taken to minimize, reduce, eliminate, or rectify the adverse impacts of a project, practice, action, or activity.

National Environmental Policy Act (NEPA): Requires all agencies to examine and disclose the environmental impacts of their actions, incorporate environmental information into project decisions, and use public participation in the planning and implementation of all actions.

National Register of Historic Places (NRHP): The national list of districts, sites, buildings, structures, and objects significant in American history, architecture, archaeology, engineering, or culture. It is maintained by the Secretary of the Interior under authority of Section 101(2)(1)(A) of the National Historic Preservation Act, as amended.

NEPA Preferred Alternative: The NEPA Preferred Alternative will be designated following circulation of the Draft EIS and consideration of all comments received in accordance with NEPA.

New Starts: FTA's primary grand program for funding major transit capital investments, including rapid rail, light rail, bus rapid transit, commuter rail, and ferries.

No Build Alternative: The No Build Alternative refers to an alternative under which no action would be taken (no infrastructure would be built and no new management or operational practices would be instituted).

Option: One of the several possibilities for an alternative. The UPRR Rail Alternative has three options: ROW Option, East Option, and West Option, each along the same general alignment but slightly different.

Right-of-Way (ROW): In transit usage, the corridor along a railway that is controlled by a transit or transportation agency/authority.

Scoping: An early and open process for identifying the extent, variety, and significance of issues related to a proposed action in the EIS. Scoping for RLE was held in the form of public open house meetings in 2009 and the scoping report is available on CTA's website.

Section 4(f): Section 4(f) of the Department of Transportation Act of 1966 states that no transportation project should be approved which requires the use of land from a public park, recreation area, wildlife and waterfowl refuge, or historic site unless there is no feasible or prudent alternative to the use of such land.

Section 106: Section 106 of the National Historic Preservation Act deals with project effects on historic properties. It requires consultation with parties with expertise and interest in historic resources.

State Historic Preservation Office (SHPO): The official appointed or designated, pursuant to Section 101(b)(1) of the National Historic Preservation Act, to administer the State historic preservation program. The SHPO consults with state and federal agencies during the Section 106 process review. The SHPO administers the national historic preservation program at the State level, reviews National Register nominations, and maintains file data on historic properties that have been identified but not yet nominated. Agencies seek the view of the SHPO in the identification of historic properties and the assessment of the effects of a project on historic properties.

Travel Time: The time spent traveling from a place of origin to a place of destination.

Union Pacific Railroad (UPRR): The UPRR owns and operates tracks and trains that run through the project corridor along Eggleston Avenue.

More Relocation Information

Business

A business that is relocated as a result of the project may be entitled to benefits such as:

1. *Moving and Related Costs*
2. *Reestablishment Costs*
3. *Fixed Payment*

Statements applicable to all categories and benefits listed

Please keep in mind that there are specific benefit requirements that must be met to receive any of the funds mentioned above. Your assigned relocation agent will assist you to fully understand the payments and requirements.

No one may be displaced until adequate housing has been made available to them.

All persons required to move personal property, their home, or business must be given at least 90 days to vacate.

Your Local Transit Agency will establish an appeal process should you be aggrieved by a denial of benefits or if you feel the benefits are inadequate.

A message from the FTA and your local transit agency

It is sometimes necessary to acquire private property and displace persons and businesses in order to build a transit facility that will benefit the entire community. However, we will work with you to minimize the inevitable disruption that this causes. Please feel free to contact the agency and person listed below should you have any further questions.

Revised rules for the Uniform Act were published in the Federal Register on January 4, 2005. The rules are reprinted each year in the Code of Federal Regulations, Title 49, Part 24. All Federal, State and local government agencies, as well as others receiving Federal financial assistance for public programs and projects, that require the acquisition of real property, must comply with the policies and provisions set forth in the Uniform Act and the regulation.

For further information, please contact:

FEDERAL TRANSIT
ADMINISTRATION

GENERAL ACQUISITION & RELOCATION INFORMATION

FTA | U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL TRANSIT ADMINISTRATION

SEE THE BACK PANEL OF THIS BROCHURE FOR INFORMATION ON CONTACTING YOUR LOCAL AGENCY.

GENERAL INFORMATION

Your local transit agency may need to purchase property from you with funding from the Federal Transit Administration (FTA) in order to benefit the general public. To assure fair and consistent treatment of all persons, the FTA will require your local transit agency to follow the Uniform Relocation Assistance and Real Property Policies Act of 1970, as amended. The Uniform Act is a law passed by Congress to promote uniformity and fairness when a local transit agency must acquire property or displace persons. There are two main parts of this process:

1. *Acquisition, which is the purchase of your real estate.*
2. *Relocation which offers additional benefits should you or your business be displaced.*

Acquisition of Real Property

The purchase of real estate by a transit agency begins with the appraisal of your property. An appraiser will inspect your property to determine the value. The property owner should accompany the appraiser while making this inspection. A second appraiser will then review and approve the work of the first appraiser and will recommend a value to the local transit agency.

You should then receive a written offer to purchase your property. You will have sufficient time to consider the offer or make any counter offers that you believe is fair.

If you elect to sell your property to the local transit agency, you will be paid the full amount less any encumbrances (mortgage, lien, etc.) owed on that property. Possession of vacant property may be taken the day of closing by the local transit agency; possession of occupied property will be at an agreed future date.

Relocation

Advisory Assistance will be offered to every displaced person. A Relocation Agent will visit you to explain all of the benefits and services that you may be eligible to receive.

Below is a very brief outline of the various types of financial benefits available if you or your business are required to move.

Residential Homeowner Occupants, are those that have owned and occupied their home for at least 180 days. Typical benefits include:

1. *Moving Costs*
2. *Price Differential Payment*
3. *Increased Mortgage Interest*
4. *Incidental Closing Costs*

90 day Occupant or Tenant, is either a tenant or a homeowner that has occupied their home for less than 180 days but at least 90 days. Relocation benefits include:

1. *Moving Costs*
2. *Rental Assistance Payment/Down Payment*

RED AHEAD
Moving Ahead to a Better Red

Red Line Extension

Welcome to the Red Line Extension (RLE) Open House

The purpose of this meeting is to:

- Provide information on the RLE Project
- Share findings regarding anticipated project benefits and impacts
- Hear and gather your feedback and suggestions
- Discuss next steps and additional opportunities to be involved

If you have questions, feel free to ask the representatives stationed around the boards.

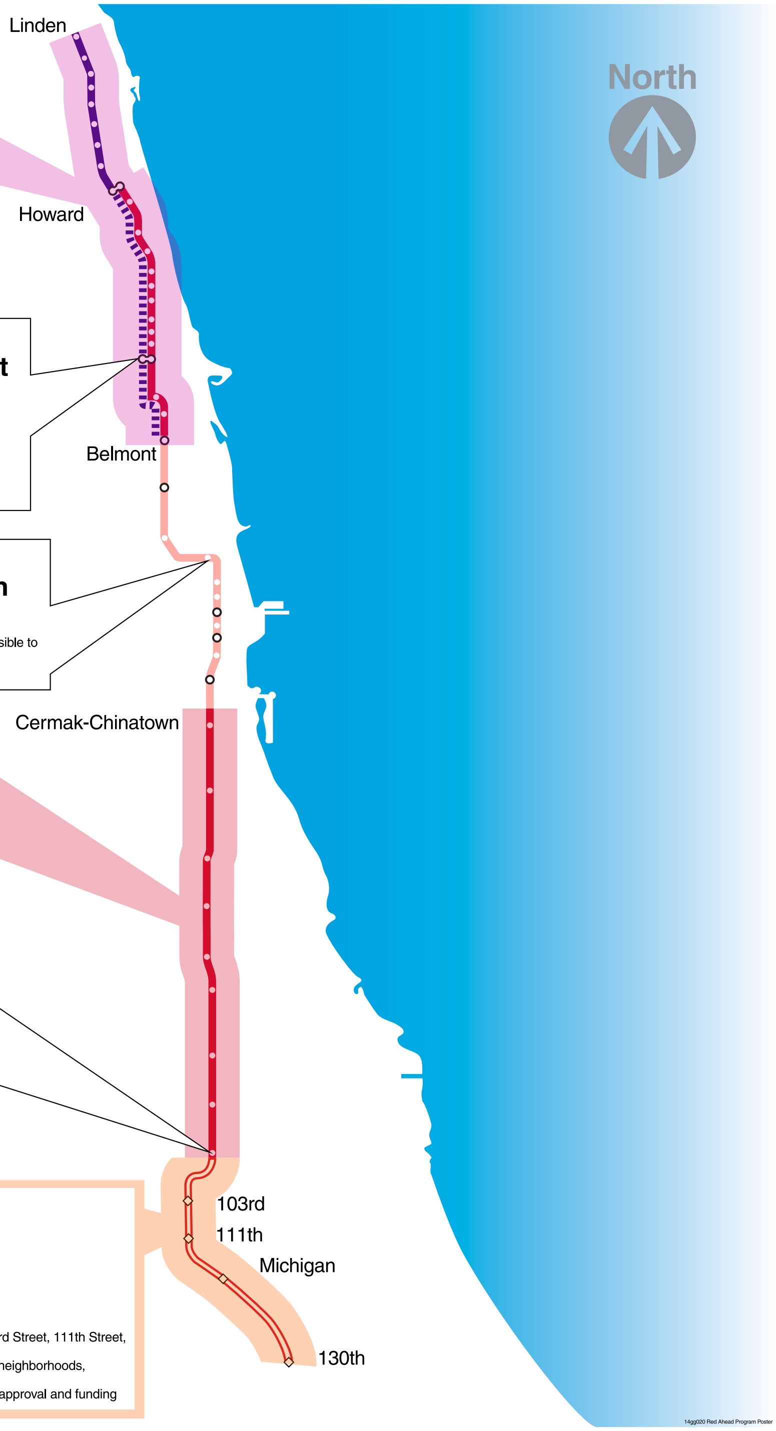
RED AHEAD

Moving Ahead to a Better Red

Red Line Extension

The Red Ahead Program

Improving the Red Line from End to End



rpModernization

Improving your commute. Improving your community.

Status: In planning
Scope:
- Multi-stage project to be completed in phases
- Rebuilding all stations, track, support structures north of Belmont
- Will result in faster rides, increased capacity, less crowding and more frequent service
- **Phase 1:**
  - – New Lawrence, Argyle, Berwyn, Bryn Mawr stations; new track and support structures along 1.3 miles
  - – New Red-Purple Bypass north of Belmont where Red, Purple and Brown lines intersect

Wilson Station Reconstruction Project

Status: Starting Fall 2014
Scope:
- Modernize station and make it accessible to customers with disabilities
- Creates new transfer point between the Red and Purple lines
- New security measures including brighter lighting and 100 security cameras

Clark/Division Station Renovation

Status: Starting Fall 2014
Scope:
- Modernize station and make it accessible to customers with disabilities
- State-of-the-art security equipment

rsr Red Line South Reconstruction Project

Status: Completed Fall 2013
Scope:
- Rebuilt tracks along 10.2 miles, from Cermak-Chinatown to 95th/Dan Ryan
- Rehabbed eight stations, all with elevators, making entire Red Line South accessible to customers with disabilities
- Shortened round-trip commutes between 95th/Dan Ryan and downtown up to 20 minutes

95th Street Terminal Improvements

Status: Starting Summer 2014
Scope:
- Redesigned and expanded terminal will increase space for busses and improve access for pedestrians
- New layout will reduce delays and congestion, and improve passenger safety
- Modern, mostly glass station and public art will improve comfort and overall transit experience

Red Line Extension

Status: In planning
Scope:
- Proposed 5.3-mile extension, including four new stations near 103rd Street, 111th Street, Michigan Avenue/116th Street and 130th Street
- Would improve service and transit accessibility for Far South Side neighborhoods, reduce commute times
- CTA progressing on a multi-step federal process to secure project approval and funding

14gg020 Red Ahead Program Poster

cta

RED AHEAD
Moving Ahead to a Better Red

Red Line Extension

What is the RLE Project?

The end of the line for the CTA's Red Line South is currently the 95th/Dan Ryan Terminal.

This year, construction will begin on the 95th Street Terminal Improvement Project, which will expand and greatly improve the 95th/Dan Ryan Terminal.

With the estimated $2.3B Red Line Extension (RLE) Project, CTA is proposing to extend service from south of 95th/Dan Ryan Terminal to the vicinity of 130th Street.

RLE Means a Better Served Far South Side

The Red Line Extension Project would:

- Serve a transit dependent area of the City that does not have direct CTA rail service.
- Provide a faster commute. The RLE would offer a 20-minute time savings by providing one-seat service, as opposed to the current bus-rail trip from 130th Street to downtown.
- Include four new stations, a new rail yard, plus bus and parking facilities at all stations.

Why are we preparing an Environmental Impact Statement (EIS)?

An EIS allows the public to fully understand the potential environmental impacts and provide input before final decisions are made.

Transportation projects seeking Federal funding are required to conduct environmental analysis. An EIS is being prepared for the RLE Project by CTA and Federal Transit Administration (FTA).

Public feedback on the preliminary impacts of the alternatives is necessary to complete the Draft EIS.

The EIS includes:

- A description and comparison of alternatives
- An explanation of the existing environmental setting
- An analysis of potential positive and negative environmental impacts of construction and operation of each alternative
- Proposed mitigation measures to reduce or eliminate potential negative impacts

Potential Impacts to Parks

Only the UPRR Rail Alternative would impact parks.

Parklands Affected by UPRR Rail Alternative Options

Parkland	East Option	ROW Option	West Option
Wendell Smith Park	0.4 acres	0.2 acres	0.2 acres
Fernwood Parkway	-	-	1.9 acres
Block Park	0.8 acres	-	-
Total	*1.2 acres*	*0.2 acres*	*2.1 acres*

Preliminary Mitigation Strategies

Coordination with Chicago Park District is ongoing to identify mitigation including improvements to other parklands or replacement parklands nearby.

Potential Property Displacements

Construction of the project would require the acquisition of property.

Permanent Displacements by Alternative

	UPRR East Option	UPRR ROW Option	UPRR West Option	Halsted	BRT
Affected Parcels without Building Displacements	149	112	144	72	49
Affected Parcels with Building Displacements	110	22	51	38	3
(Residential Building Displacements)	(95)	(17)	(30)	(17)	(1)
Total Affected Parcels	*259*	*134*	*195*	*110*	*52*

Impacts presented are:

- Based on Conceptual Engineering and represent maximum impacts on all alternatives
- For the purposes of comparing alternatives and will be confirmed in the Final EIS following more detailed conceptual design of the single NEPA preferred alternative

All major transit construction projects have impacts:

- The Brown Line Expansion had 40 building displacements
- The RPM Program (Phase One) may displace 19 buildings

Preliminary Mitigation Strategies

Property owners would be paid not less than fair market value for their land and buildings, and may be eligible for compensation equal to the original purchase price of the property. They would also be assisted in relocating their businesses or dwellings, per the Federal Uniform Act on relocation assistance and property acquisition.

When a single alternative or option is chosen, CTA will work with the community and property owners to minimize property impacts.

RED AHEAD

Moving Ahead to a Better Red

Potential Noise Impacts

Noise Impacts by Alternative

	UPRR East Option	UPRR ROW Option	UPRR West Option	Halsted	BRT
Moderate and Severe Noise Impacts	None	None	None	Moderate impacts would remain after mitigation	Moderate impacts south of 120th Street
Vibration Impacts	None	None	None	None	None

Moderate Noise Impacts: The change in noise would be noticeable but might not be sufficient to cause a strong, adverse community reaction
Severe Noise Impacts: A significant percentage of the population would be highly annoyed by the change in noise

Preliminary Mitigation Strategies

Continuous welded rail

- Fewer joints mean a smoother and quieter ride

Jointed Rail versus Welded Rail

Closed deck structure

- Limits noise beneath the elevated tracks

Open Deck versus Closed Deck

Noise barriers

- Absorb railway noise

Noise Barriers

Potential Noise Impacts and Mitigations

Preliminary Mitigation Strategies

- Provide new landscaping or other urban design amenities
- New structures would reflect the character of neighborhoods or communities to the extent feasible
- Careful placement of exterior lighting adjacent to residential communities
- Construction best management practices including maintaining vegetation and debris-free construction areas

RED AHEAD
Moving Ahead to a Better Red

Red Line Extension

Potential Effects to Historic Properties

- Historic experts evaluated a sample of 541 properties near the project alternatives
- CTA/FTA invited interested parties to help evaluate potential historic resources
- CTA/FTA identified two historic districts and 13 properties that have been recommended for inclusion on the National Register of Historic Places

Adverse Effects by Alternative

	UPRR East Option	UPRR ROW Option	UPRR West Option	Halsted	BRT
Effected Properties	0	0	0	4 adversely effected after mitigation *but not demolished*	0

Preliminary Mitigation Strategies

Consultation with the State Historic Preservation Office and other interested parties is ongoing to confirm effects and identify mitigation strategies.

An adverse effect occurs when a project alters (directly or indirectly) any of the characteristics of a historic property that qualify it for the National Register, diminishing the integrity of its location, design, setting, materials, workmanship, feeling, or association.

931 W. 120th Street (Fire Department Engine House)

12433 S. Halsted Street (S.S. Peter and Paul Church)

12540 S. Halsted Street (Cedar Park Cemetery)

10227 S. Halsted Street (Former Classic Revival Substation)

These properties will not be demolished but would have potential adverse effects due to potential visual, noise, or construction impacts.

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

I have resigned myself to the fact that the Red Line Extension is years away from completion. In the INTERIM, I propose a TEMPORARY RED LINE EXTENSION via one of the following routes
A State; 103rd Wentworth, 119th, Michigan 127th, Indiana & 130th between 95th Street and FOMOCO
B State, 127th Indiana, 130th,
BOTH: Stops would be limited to 103rd, 107th, 111th, 115th, 119th 127th; METRO WATER, and FOMOCO

OVER →

How do you use the following parks? (Check all that apply)

	Baseball / Softball / Basketball	Playground	Walking / Jogging	Community Events	Other	I do not use this park

Fernwood Parkway (Eggleston Avenue between 99th and 103rd Street)	☐	☐	☐	☐	☐	☐
Block Park (103rd Street / Harvard Avenue)	☐	☐	☐	☐	☐	☐

cta

Additional Comments:

1 Michigan Avenue is WAY TOO Narrow for a BRT of any kind

2 Halsted Street is MUCH BETTER SUITED for a BRT, a Subway, or an overhead system, A Light Rail should be avoided Remember the 1950 Streetcar Crash @ 63d & State

3 My proposed Halsted Street BRT should run from the GRESHAM Metra (Rock Island) Station @ 86th Vincennes and Halsted to FOMOCO via Vermont, 127th Indiana and 130th Streets, with stops @ 95th 99th 103rd 107th 111th, 115th, 119th, 123rd 127th Vermont Halsted Bus Terminal State/Michigan, Metro Water Reclamation and FOMOCO

SUMMARY & SYNOPSIS

The area between 79th Street to the Southern City Corporate Limits and between Ashland and the State Line IS A TRANSIT DESERT SOME FORM OF INTERIM RAPID TRANSIT IS NECESSARY That interim system should be implemented most quickly at the lowest possible cost. It should also be a 24/7/365-6 alternative

Thank you for attending this CTA Red Line Extension Project open house.

☑ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

- The rail alternatives must be pursued. The "BRT" Line may not have a dedicated lane which means it would get stuck in traffic.
- If the UPRR Alternative is pursued, pedestrian access must be addressed for 130th street. It's not pedestrian friendly at the moment.
- Parking should be minimal at best. Creating large parking lots adjacent to the sidewalk is poor planning because it is not pedestrian friendly. Areas around stations should have (cont.)

How do you use the following parks? (Check all that apply)

	Baseball / Softball / Basketball	Playground	Walking / Jogging	Community Events	Other	I do not use this park
Wendell Smith Park *(99th Street / Princeton Avenue)*	☐	☐	☐	☐	☐	☒
Fernwood Parkway *(Eggleston Avenue between 99th and 103rd Street)*	☐	☐	☐	☐	☐	☒
Block Park *(103rd Street / Harvard Avenue)*	☐	☐	☐	☐	☐	☒

cta

Additional Comments:

(cont. from last page) street-level, pedestrian-oriented retail or be mixed with housing. Parking lots would exclude the possibility for Transit Oriented Development on either rail alternative if they are large and sidewalk adjacent.

- I have seen extremely long trains on the UPRR passing through. Could pedestrian underpasses or bridges be constructed? They are long trains that block the intersections, making it impossible to pass.

Thank you for attending this CTA Red Line Extension Project open house.

☐ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

I want to Know about the impact on my house, if there is an additional train that goes by every 10 min 24/7. My house already shakes from the freight train, I do not want additional vibration to distribute my house any more. How many homes will have to be remove if the train goes along side UPRR? There need to be several different meeting before the project is in final preparation.

Additional Comments:

Please take into consideration that most people who live around this new Red Line Extension are older & retired, and on a fix income. Asking these people to move, you should take into consideration the market value, offering them relocation cost and so portion of the closing cost. Do not be insensitive to the fact that these people lived here most all their life, and to up root them will affect them emotional. Do not make these decision based on profit but also people life. I would think going down Halsted would be a better decision, this way people won't have to move.

Thank you for attending this CTA Red Line Extension Project open house.

☑ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

The BRT alternative is my preference as it adds to the existing service, Without knowing if there would be bus lines to support access to the proposed rail lines it is not possible for me to see how the rail lines would improve the current situation. I am saying this based on the premise that either the Halsted or Michigan ave bus service

How do you use the following parks? (Check all that apply)

	Baseball / Softball / Basketball	Playground	Walking / Jogging	Community Events	Other	I do not use this park
Wendell Smith Park (99th Street / Princeton Avenue)	☐	☐	☐	☐	☐	☑

cta

Additional Comments:

would be discontinued based on whether the UPRR
rail or Halsted rail is built. While all of the plans
would reduce traveling times, they also reduce
access to the service, as the stops would be
severely reduced. Perhaps in the future you
can lett the public know what supportive
bus service, if any, would be available.

Thank you for attending this CTA Red Line Extension Project open house.

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

How do you use the following parks? (Check all that apply)

	Baseball / Softball / Basketball	Playground	Walking / Jogging	Community Events	Other	I do not use this park
Wendell Smith Park *(99th Street / Princeton Avenue)*	☐	☐	☐	☐	☐	☐
Fernwood Parkway *(Eggleston Avenue between 99th and 103rd Street)*	☐	☐	☐	☐	☐	☐
Block Park *(103rd Street / Harvard Avenue)*	☐	☐	☐	☐	☐	☐

Additional Comments:

My main concerns are you had your house built and now paid for and now your home is going to be taken away and you wont get enough money to pay in full for a home at todays prices. We don't want to sell our property a very low price and dont even come up or left with anything extra.

Be fair to all.
God Bless you

Thank you for attending this CTA Red Line Extension Project open house.

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

- BRT IS UNACCEPTABLE
- I AM CONCERNED THAT CTA OR THEIR MGRS. of existing PARK + Rides (ARCHER ORANGE / Logan Sq - BLUE)
- I AM CONCERNED THAT CTA WILL NOT TAKE THE COMMUNITIES NEEDS INTO ACCOUNT AFTER THE DRAFT EIS IS COMPLETED.
- I AM CONCERNED ABOUT MITIGATING AIR POLLUTION DURING CONSTRUCTION + OPERATION

(OVER)

Block Park *(103rd Street / Harvard Avenue)*	☐	☐	☐	☐	☐	☐

cta

Additional Comments:

- I BELIEVE THE WEST STATION OPTION WILL PROVIDE CTA SERVICE TO AN EMBARASSINGLY UNDERSERVED (BY CTA) COMMUNITY.

- I BELIEVE THE GREATER ECONOMIC OPPORTUNITY FOR THE CTA, THE CITY + THE COMMUNITY IS THE CURRENT PERFERRED OPTION

Thank you for attending this CTA Red Line Extension Project open house.

☐ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

- Except for the service to Altgeld, bus rapid transit does not provide much over the existing alternatives - especially without designated lanes.

- Halsted rail alternative doesn't serve underserved communities to the east (and impacts historic properties)

How do you use the following parks? (Check all that apply)

	Baseball / Softball / Basketball	Playground	Walking / Jogging	Community Events	Other	I do not use this park
Wendell Smith Park *(99th Street / Princeton Avenue)*	☐	☐	☐	☐	☐	☒
Fernwood Parkway *(Eggleston Avenue between 99th and 103rd Street)*	☐	☐	☐	☐	☐	☒
Block Park *(103rd Street / Harvard Avenue)*	☐	☐	☐	☐	☐	☒

cta

Additional Comments:

* My primary concern is service to the communities East of State - Altgeld and Hegewisch. #30 needs to connect with a South or west station alternative - there are just as many people living E of Stoney Island as there are in Altgeld to the west.

Overall the UPRR alternative ~~or~~ seems to provide the fastest service to the largest # of people.
I think environmental concerns could be mitigated with careful planning - there is a large amount of vacant industrial space to utilize.

Thank you for attending this CTA Red Line Extension Project open house.

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

I do not like/agree with either Station location at 130th. The two locations are very poorly planned interms of serving the community. For better benifit to the system/community, have the CTA Station at 130th to terminate at the Ford motor plant and the surrounding industrial park. A better location would be the establishment of a major transfer point on

How do you use the following parks? (Check all that apply)

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

FIRST, LET ME START BY STATING I FEEL LIKE I ~~B~~ WAS INVITED TO THE Party AFTER ITS STARTED.
① PROPERTY Values! CONCERNED w/ HOW THIS will EFFECT THE RE SALE Value.
② SENIOR RESIDENCE! THE PROPOSED ELEVATED RAIL LINE ALONG Eggleston HAS THE potential TO Displace SENIOR RESIDENCE. NOT ONLY THAT but you would be CHANGING THE ENVIRONMENT, INCREASING CAR AND PEDESTRIAN TRAFFIC.

How do you use the following parks? (Check all that apply)

	Baseball / Softball / Basketball	Playground	Walking / Jogging	Community Events	Other	I do not use this park
Wendell Smith Park (99th Street / Princeton Avenue)	☐	☐	☐	☐	☐	☒
Fernwood Parkway (Eggleston Avenue between 99th and 103rd Street)	☐	☒	☐	☐	☐	☐
Block Park (103rd Street / Harvard Avenue)	☐	☐	☒	☐	☐	☐

cta

Additional Comments:

2 CONT.; IF FORCED TO Sale will I get compensated.
AND FAIR MARKET Value, WHO DeterMINES THAT.
Is THAT BASED ON TODAYS COST.
③ ENVIRONMENT
④ INCREASED CRIME?

Thank you for attending this CTA Red Line Extension Project open house.

☑ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

It appears to me that your concern is not for the residents. Your primary focus seems to be what can bring the most money for those who will invest in this project. I find that government has little or no concern for the people, even though they say they do. I will be praying that God will do what is best for the population at large and that greed will not dictate your decision.

cta

Additional Comments:

I have lived at my current resident 1971. I cannot imagine day in and day out listening to a train as it constantly goes by.

I would hate to see an over head train one-half block from my house.

This is a residential area and it would be inappropriate to alter my community to that degree.

If you wanted to buy my property, I would not object, but I definitely would not want to live there if these changes occurred.

Thank you for attending this CTA Red Line Extension Project open house.

☒ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

To ensure that local residents have equal access to some of the projected 2,000 plus construction jobs, the CTA needs to enter into a Community Benefit Agreement with the Developing Community Project. A draft of such an agreement with the assistance of a pro bono law firm is currently being drafted.

(Continues on the back)

How do you use the following parks? (Check all that apply)

	Baseball / Softball / Basketball	Playground	Walking / Jogging	Community Events	Other	I do not use this park

Block Park (103rd Street / Harvard Avenue)	☐	☐	☐	☐	☐	☐

cta

Additional Comments:

Entering into a CBA with a local recognized community group could become ~~how~~ of a model / for local residents can successfully obtain training and jobs on other public works projects. Being discussions and negotiations with DCP early would be a way defusing the tension surely to arise regarding employment opportunities for local residents. DCP's Workforce Collaborative is willing and able to discuss this matter in more detail whenever the CTA calls.

Thank you for attending this CTA Red Line Extension Project open house.

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

I'm excited to see the red line extended to 130th Street. Please don't pick the Bus Route. I know it is cheaper and less impact on community but it won't improve commute. The Halsted/Rail Alternative will make too much of an impact in regard of properties.

May 13, 2014

Red Line Extension Project

To whom it may Concern:

We as residents of 115th and State Street would like to know exactly where the purposed station, the tracks and the parking are going to be at the Michigan Avenue (115th Street Station). In the past we were told various things, such as an Aldi's was to be built at 115th and State. Then all of a sudden the sign disappeared and there is only vacant land from Michigan to State.

Since an environmental survey was done, what are the results for the area where are homes are located? How far east or west, north or south did the survey go? The majority of our homes were built in the late 1800's, hence the name West Pullman, so how will the noise and the vibrations affect the foundation of our home.

Sincerely,

Charles and Stella Brown

12 West 115th Street

Chicago IL 60628

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

Please see attachment letter.
Why this meeting today? A focus group is needed before plans are made.
This meeting is probably just a "formality" to say "We asked you for your input."
CTA officials have already decided what will be done. This "Open House" is an insult to the average man's intelligence.

Mr. Gerald Nichols
Representative - CTA
CTA Government and Community Relations
Chicago, Illinois

May 7, 2014

Subject: **95th Street Red Line Extension Project**

Issues: *Accountability, Transparency, Economic Benefits (if any) for 9th Ward Residents

Dear Mr. Nichols:

This is a letter requesting specific, **written answers** to important questions regarding the Proposed 95th Street CTA Red Line Extension.

Please provide the complete list of addresses of homes and businesses slated for demolition in the 9th ward for the 95th Street Red Line Extension Project along both proposed routes.

Where is the complete budget?

According to The Sun-Times:

Construction of a new station at the end of the Current Red Line	$240 million
Five mile plus extension of the Red Line from 95th to 130th Street	$ 2 billion

Furthermore, sources indicate that there is an additional $425 million plan to close the Red Line for 5 months with the argument that the closure Is needed because the current 95th Street Station has to be rebuilt (even) before it can be extended. Whose fault is that? What have the Aldermen done to take care of their communities on the South Side?

This awful, decrepit condition of the 95th Street Station is the result of years of neglect on the upkeep and safety of the 95th Street Station. Currently, the station is filthy. The concrete block with railings on the east side of the bus terminal is broken in spots, the rails are rusted. There is no evidence that the station has been painted or power washed in years.

Please list the complete, itemized budget for all persons receiving payment. Please list the business names, owners and addresses of all persons receiving compensation. **Who's really making the money on this project?**

Companies	Contracts Amounts
Electrical contractors	$__________
Mechanical engineers	$__________
Architectural firms	$__________
Wrecking companies	$__________
Painters	$__________
Trash removal/ disposal companies	$__________
HVAC companies and specialists	$__________
Security systems installers	$__________
Construction companies	$-__________
Portable toilet(s) companies	$__________
Project consultants	$ __________
Specialized Equipment	$__________
Lawyers, legal fees, etc.	$__________
Any and all other persons receiving compensation	

85% of jobs must reflect the racial diversity of the community in which the construction project(s) will take place (9th Ward). Who's responsible for making this happen for our community?

Who is Melody Carvajal? Who is Melody McKissack?

CTA's Relocation Consultant is Melody Carvajal. What is her job description? What is her **annual salary?** Who appointed her to this position? Is she a licensed real estate broker? Is she an urban planner? What are her educational and financial credentials? What are her previous achievements as a relocation consultant? Why isn't her voice mail box not yet even set up?

We are requesting a complete list of addresses of all homes and businesses in the 9th ward that will be destroyed.

The people who bought homes in Roseland in the 70's and 80's were young parents buying their first home. And guess what? When the color changes, the service changes. Today, these young parents are now senior citizens on fixed incomes who raised their children, put them through college, took care of elderly parents and paid property taxes all these years. They have roots here. They have neighbors who look out for them in extreme heat and inclement weather. Their homes are part of their legacies that can be passed on to their children. Their fixed incomes and property taxes pay salaries for corrupt politicians at City Hall.

However, sources indicate that Rahm Emanuel only wants to give homeowners what they originally paid for their homes. Please explain how this scheme benefits families whose homes are demolished and taken away from them.

For the record, any and all homeowners who lose their homes must be compensated according to replacement cost value (as determined in their homeowner's **insurance policies)** – not historical evaluation. Homeowners should be compensated for moving expenses and/or relocation costs, home inspections and closing costs on their new home. Displaced homeowners have the right to make a lateral move with no increase in property taxes, homeowners insurance and/or water bills. We need a written, detailed explanation and specific information on how these families will be compensated for their homes being destroyed.

What are the hourly parking fees (rates) for the 4 new stations' parking facilities?

If the purpose of a focus group is to gather data and input, why is this Focus Group being held after all the plans and budgets have been made? How many 9th Ward residents were involved in the initial stages of planning? Is this meeting just a "formality" to say, "Yes. We included you."

This is only Part I of a series of unanswered questions about the Red Line Project. Please send a written response within the next 3 business days. Thank you.

Respectfully,

Nancy Wimberly

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

With regard the certain Historic sites / dwellings this extension should bring an awareness the Pullman Roseland area.
It should also finally bring an end to the transporation desert that has separated this portion of the city from the rest of Chicago.
Bravo !!

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

In a 2009 referendum, the Community voted to recommend the "Community Route", which follows the Union Pacific rail lines. There were 43,000 people who voted, making it the largest referendum in Chicago history. It is my hope that the Choice of the Community will be honored!

☐ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

I support the UPRR alternative - whether directly on the ROW or west/east of it. (though east seems to be the less disruptive of the two, so I guess I'd prefer that). I would ask CTA to consider potential transfer opportunities between Metra and CTA, especially near Kensington station

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

When my polling place was changed to St thaddeus Church from Euclid Park(I voted there since 1967) that put me into another ward, precinct putting my house value to a lower value. Very frankly I feel as if I have been bamboozled! with your fair market pricing.

☑ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

The salient impact of both the Red Line Extension and renovation of the 95th street station will be profound in terms of the economic significance along the 1/2 mile West Corridor at 95th street. Please ensure that attention is paid to this four-block area, west of the renovated station so the desired walkable community indeed comes to fruition.

☒ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

IF THE EAST OPTION IS SELECTED I'M CONCERNED ABOUT THE NOISE.
ALSO I DON'T UNDERSTAND WHY THERE IS NO OPTION FOR THE RED LINE EXTENSION BEYOND 95TH DAN RYAN ON AROUND TO THE BISHOP FORD TO 130TH.
WHATEVER RAIL OPTION IS DECIDED THE BRT ALTERNATIVE SHOULD GO ALONG WITH IT. THE BUS SERVICE IN THAT AREA IS UNDER SERVICED NOW.

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

VERY DISAPPOINTED ABOUT THIS PRESENTATION, I'VE ATTENDED BEFORE AND IT DOESN'T LOOK AS THOUGH MUCH TECHNICAL PROGRESS HAS BEEN MADE; THIS SHOULD NOT BE A DECISION BASED ON PRETTY PICTURES; NEED MORE FINANCIAL & TRANSIT RELATED INFO. WHY TO ALTGELD GARDENS? WITH SO MANY VACANT LOTS, IT IS SHORT SIGHTED TO FOCUS ON THAT AREA SO FAR REMOVED FROM CITY CENTER. THANKS FOR YOUR CONSIDERATON.

☑ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

Have CTA considered using Rapid Transit Cars/Buses ~~[illegible]~~ on the new Halsted Rail Alternative Line? Since Halsted Street is two lanes running both North & South with a divider, it offers more space than Michigan Avenue for such a purpose. I have to believe that it will be more cost-effective than operating the existing red-line trains/cars on the Halsted Rail Alternative proposal?

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

As that I have been following the project since 2006, I think that the UPPR Alternative East Option would be the best selection because it would eliminate alot of the existing congestion at the 95th terminal, and it would give riders better options and access that would be coming from the South East Suburbs + Northwest Indiana. It would also allow for less congestion on the Bishop Ford Expressway, and allow for more jobs to open up in this corridor

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

CMAP identified the 'Grey Line' project in 2010 utilizing excess capacity on the Metra Electric to provide CTA access & connectivity to Roseland, West Pullman, Pullman & Hedwisch The Grey Line could be brought online much more quickly than the Red Line and would complement service for the Red Line. Rapid Transit could be provided for these residents 5 years earlier.

☒ *Check here to also receive updates about other projects along the Red Line.*

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

the Halsted Rail alternative should not be an option. Halsted is a main Street out south. Halsted is busy with rush hour traffic in the a.m. and p.m. the noise of the rail line Would be awful, the traffic from the train stops would be awful as well as the look of the overhead tracks. I live one Street West of Halsted and Would definatly not Want the extension to run down Halsted, Economic development is always good for a Community, but how do we know the extension down Halsted will REALLY Improve our Community?

What specific comments or concerns do you have about the Red Line Extension alternatives, potential impacts, and mitigation measures?

Impacts: How many families will be displaced by the extension? Will this project infuse an ~~economic~~ revenue stream into those communities impacted? How will this opened impact race ridership? What is the volume of riders expected to utilize the extension? Increased traffic introduces increased risks. What are the safety/security concerns tied to this project and how will they be mitigated? What %age of the jobs created from this initiative (short and long term as well as permanent, will be recruited for out of the communities that will be impacted?)

Sirs:

Although I will not be able to attend the public hearing, I suggest the CTA expand its plan for the Red Line Extension to include the line to extend to just north of I-80 in Lansing with a terminus, triple-decker garage parking area (Kiss n' Ride) with bicycle racks, and rail yard there for all south suburban rides to get to the Loop, with a stop at 159th Street near the River Oaks Mall in Calumet City and one stop at Sibley Boulevard.

Sincerely,

Martin Edward Lewis

I'm open to just about every option except for the Halsted option because that will go to Halsted & 127th, but it won't serve Altgeld Gardens, as residents there feel isolated from the rest of Chicago. I think that the existing #34 South Michigan should be served with articulated buses. I'd go with you purchasing whole new articulated buses or purchasing and refurbishing articulated buses previously used by another transit agency (as well as if your final decision is to implement the BRT route).

Arlene,

Thank you for your interest in the Red Line Extension Project.

We appreciate your input and thank you for taking the time to provide comments. We will take your comments into consideration as we develop the Draft Environmental Impact Statement. Please visit our webpage at www.transitchicago.com/Redeis to learn more about the project and to follow the progress of the Draft Environmental Impact Statement.

Subject: Comments on the Red Line Extension

Chicago Transit Authority, Strategic Planning
567 W Lake St, 10th Fl
Chicago, IL 60661-1465

May 20, 2014

Dear Madam or Sir,
I attended the Open House for the Red Line extension on May 13, and I have several concerns about the project. The overriding issue is that inadequate funds are being committed to such a major project, and because of the inadequacy of the funding, the options for and the scope of the extension are severely limited to the point that the finished product will be a solution that disrupts many, and adequately serves the transportation needs of few.

A subway is needed. Any train that travels above ground will cast a pall on any throughway that it is over or near. The support posts and the overhead structure will be intrusive to the street scape, and the clamor of the train and the announcements from the train will be a permanent noise nuisance to people blocks away.

The Halsted overhead alternative is not likely to appeal to anyone with property along the route. What business would welcome an overhead transit structure in front of it? What household would want the noise of an above ground train anywhere within hearing? What pedestrian would choose to walk along a street covered by a set of train tracks? An above Halsted train will take a throughway that needs to be lifted up, and turn it into a street that upstanding members of the community try to avoid. Not so for the less upstanding members. The structure and support posts will provide many opportunities for graffiti and for thieves and lawbreakers to hide behind to the detriment of any pedestrians unwise enough to walk down the street.

The Michigan Avenue Bus Rapid Transit is rapid in name only. While the route would serve many, the bus will not be rapid, and will do little more than give true BRT a bad name. I learned at the open house that the BRT will be only 5 minutes faster than the present #34 Michigan. This, as you well know, is nothing like Bus Rapid Transit.

The locally preferred alternative is preferable only because it is the least disruptive to businesses and homes along and near Halsted. The train stations do not seem to serve areas populated by any significant population, and the while the end of the line is nicely located to serve Indianans and suburbanites who want to park and ride, the main purpose of the line should be to serve south siders whose rapid transit needs have been long ignored.

The scope and permanency of any rapid transit project is great enough that accommodation for the future success of the neighborhood should be taken into account before abandoning an option because it's too expensive. If the project cannot be done right, then increased and timely bus service should be added to the affected streets, and the funds should be banked until such time as a commitment to adequate funding can be made. Please do not impose this permanent, noisy, unsightly, and potential crime haven on a thoroughfare that needs a subway.

Sincerely,
Arlene Echols

Dear Sir/Madam;

This is Doojong KOH, working for Hyundai-Rotem Company (train and railway system provider) and got informed this project today.

I will be appreciated if you inform its project schedule and qualifications for joining this bidding.

Best regards,

Doojong KOH

Section 1
Introduction

The Federal Transit Administration (FTA), as lead federal agency, and the Chicago Transit Authority (CTA), as the project sponsor, have jointly prepared a Draft Environmental Impact Statement (EIS) to evaluate potential impacts on the human and natural environment that may result from the construction and operation of Red Line Extension (RLE) alternatives including the Locally Preferred Alternative. As part of the Red Ahead Program, the CTA proposes to extend the existing Red Line 5.3 miles south from the existing 95th Street Terminal. CTA proposes to cover a portion of the project funding by applying for federal funds administered by the FTA.

This report identifies the purpose and need for transportation improvements within the project area. Developed from the Purpose and Need statement presented in the RLE Alternatives Analysis document, as well as from input received from the public during the EIS public scoping process, this report describes CTA's basis for advancing the proposed action, identifies objectives that frame the development and evaluation of the alternatives, and sets the stage for subsequent National Environmental Policy Act analysis leading to the final agency decision on the proposed action.

Section 2
The Purpose of the Red Line Extension Project

The purpose of the RLE Project is as follows:

- Reduce commute times for residents both within and south of the project area.
- Improve mobility and accessibility for transit-dependent residents in the project area.
- Improve rapid transit rail service to isolated areas and provide viable linkages between affordable housing (e.g., Altgeld Gardens Housing Complex),[1] jobs, services, and educational opportunities, thereby enhancing livability and neighborhood vitality.
- Provide an opportunity for potential connections and linkages to other public transportation modes including regional commuter rail in the project area.
- Foster economic development in the project area, where new stations may serve as catalysts for neighborhood revitalization and help reverse decades of disinvestment in local business districts.
- Provide a modern, efficient rail car storage yard and shop facility to provide storage and cost-effective preventive maintenance for rail cars associated with the RLE Project, rail cars currently stored in the existing 98th Street Yard and Shop, and rail cars supporting additional Red Line expansion of service.

---

[1] The Altgeld Gardens Housing Complex meets the FTA's definition of *legally binding affordability restricted housing*. This definition includes, but is not limited to, state or federal-supported public housing and housing owned by organizations dedicated to providing affordable housing. The Altgeld Gardens Housing Complex is owned and operated by the City of Chicago Housing Authority.

Section 3
The Need for the Red Line Extension Project

The need for the RLE Project is demonstrated by the following existing conditions:

- Transit trips to jobs are longer for Far South Side residents than they are for commuters in the Chicago region as a whole.
- Transit-dependent populations in the project area have limited direct access to rapid transit rail service.
- The project area is geographically isolated from major activity centers and provides residents limited viable transportation options, which limit access between affordable housing (e.g., Altgeld Gardens Housing Complex), and employment centers outside of the project area.
- Existing transit markets are underserved and transit connectivity is challenging in the project area.
- Disinvestment and limited economic development in the project area have negatively affected Far South Side communities.
- The existing 98th Street Yard does not have capacity to store rail cars for any substantial increase in Red Line capacity accompanying future Red Line expansion.

Section 4
The Red Line Extension Project Area

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries extend from 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south (see **Figure 4-1**).

The project area includes expressways, regional arterials (through roads), commuter and freight railroads, intermodal connectors, local streets, and pedestrian facilities. The expressways that pass through the project area are Interstate 94 (I-94, also known as the Dan Ryan Expressway north of 95th Street and the Bishop Ford Freeway south of 95th Street) and Interstate 57 (I-57). I-94 runs north-south from 95th Street to 99th Street, curves east, then curves south and extends along the west side of Lake Calumet. I-57 splits from I-94 at 95th Street, runs south, on an alignment east of the Metra Rock Island District commuter rail line to 115th Street, then curves south along the western limit of the project area. Halsted Street and Ashland Avenue are the only north-south arterial streets that extend well beyond the northern and southern project limits.

Commuter rail in the project area is operated by Metra and includes the Rock Island District, Electric District Mainline, and Electric District Blue Island Branch. The Northern Indiana Commuter Transportation District operates the South Shore Line, which shares tracks with the Metra Electric District Mainline north of 115th Street. Freight trains in the project area use tracks owned by the Union Pacific Railroad, Canadian National Railroad, Chicago South Shore & South Bend Railroad, Norfolk Southern Railroad, and Indiana Harbor Belt Railroad.

The project area comprises residential (primarily single-family), industrial (both existing and vacant), and commercial development. It encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, South Deering, West Pullman, Riverdale, and Hegewisch.

The ethnicity of the population in the project area is predominantly Black or African American, ranging from 89 percent in the Village of Calumet Park to 97 percent in Roseland and Washington Heights. A majority of the project area population is low income.

Section 5
Justification of the Purpose and Need

5.1 Long Transit Trips to Job Centers for Far South Side Residents

Lengthy travel times affect low-income, minority, and transit-dependent populations in the project area. During 2005–2010, commute times were 24 percent longer for project area residents than for other commuters in the Chicago region (see **Table 5-1**). The Chicago region is a seven-county area including the counties of Cook, DuPage, Kane, Kendall, Lake, McHenry, and Will. The average commute time in the Chicago region was 31.6 minutes one-way, while commute times for residents in the project area averaged 39.3 minutes. **Figure 5-1** details commute times in the project area.

Figure 5-1: Mean Travel Time to Work (Minutes)

On the region's expressways and major arterials, traffic congestion has steadily increased over the past decades. In the project area, roadway capacity constraints and expressway and arterial traffic congestion limit the mobility of residents. **Figure 5-2** shows existing traffic volume per roadway capacity (AM peak period, 2010) on project area roadways based on 2010 data. The 2010 traffic data is based on actual traffic counts provided by the Chicago Department of Transportation and Illinois Department of Transportation. Chicago is ranked seventh in the nation for travel time ratio (peak travel times versus free flow travel time), and third for travel delay, excess fuel consumed, and total congestion costs (Texas Transportation Institute 2011).

Substantial traffic congestion occurs on expressways and arterial streets throughout the project area. Traffic on the roadway network is approaching capacity during the morning peak period and congestion is expected to worsen by 2030 (see **Figure 5-3**). At-grade freight railroad crossings cause further delays on arterial streets, affecting travel times to the CTA 95th Street Terminal. The Union Pacific Railroad operates approximately 27 trains per day through the project area and has at-grade crossings at several east-west arterials. Similarly, delays occur due to the Metra Electric District Blue Island Branch commuter trains, which have at-grade crossings at several major arterials. The *Transportation Technical Memorandum* contains additional information about existing traffic conditions and CMAP traffic projections.

Figure 5-3: Projected Traffic Volume/Capacity (2030, AM Peak Period, No Build Alternative Conditions)

Complex transfers to reach the 95th Street Terminal make commute times greater than two hours one-way for some project area residents (Chicago Metropolitan Agency for Planning [CMAP] 2012). Project area residents accessing the station by bus and other modes of transportation experience measureable delays and difficult transfers resulting from congestion at arterial street intersections. Travel times to jobs north of 95th Street, including the major employment centers in downtown Chicago, are long for both auto and transit commuters.

High unemployment rates in the area indicate the need for improved access to jobs, as shown in Table 5-2. By 2030, the jobs-to-population balance is expected to improve for the project area from one job for every seven adult residents in 2010 to one job for every five adult residents. This ratio would represent improved access to jobs in the project area; however, at that ratio, the area would remain far below the existing and forecasted city and regional averages of one job for every two adult residents in years 2010 and 2030, respectively (CMAP 2012, 2013).

Table 5-2: Unemployment Rates in Affected Communities

Area	Unemployment Rate
Seven-County Area	19.9%
City of Chicago	12.0%
Red Line Extension Project Area	19.0%
Community Areas within the Project Area	
Washington Heights	18.8%
Roseland	21.2%
Morgan Park	17.0%
West Pullman	18.5%
Pullman	21.4%
Riverdale	34.8%
Village of Calumet Park	17.4%

Source: ACS 2009-2013 5-Year Estimates

5.2 Transit-Dependent Populations Lack Direct Access to Rapid Transit Rail Service

The majority of the project area population is low income. According to the 2010 U.S. Census, the median household income in the project area is $41,014, which is less than the median household income for the City of Chicago ($46,877), and also less than the median household income for the seven-county area ($61,863) (U.S. Census Bureau 2010). The community with the lowest median household income in the project area is Riverdale ($11,181), which is substantially lower than the rest of the project area and the City of Chicago. The community with the highest median household income in the project area is the Village of Calumet Park ($53,785). While the seven-county region, the City of Chicago, and the project area all experienced a decline in median household incomes between 2000 and 2010, the project area has experienced a far greater decline (see **Table 5-3**).

Table 5-3: Household Income Declines in Red Line Extension Project Area (2000 to 2010, 2010 Dollars)

Area	2000 Median Household Income	2010 Median Household Income	Percent Change
Seven-County Area	$ 66,064	$ 61,863	-6.8%
City of Chicago	$ 48,911	$ 46,877	-4.3%
RLE Project Area	$ 49,548	$ 41,014	-20.8%

Source: U.S. Census Bureau 2010

Lengthy travel times to jobs are a particular problem for transit-dependent populations in the project area. Based on the number of vehicles available per household, transit-dependency is higher in the project area than in the seven-county region (see **Table 5-4** and **Table 5-5**). As **Table 5-5** shows, the project area has higher percentages of elderly and disabled populations than the seven-county region and the City of Chicago, along with lower household income levels.

Table 5-4: Vehicle Ownership - Indicator of Transit Dependency

Area	Average Household Size	Total Households	No Vehicle Available	1 Vehicle Available	2 Vehicles Available	3 or More Vehicles Available
Seven-County Area	2.84	3,824,379	229,889 (6%)	963,008 (25%)	1,576,468 (41%)	1,055,014 (28%)
City of Chicago	2.52	1,161,573	177,352 (15%)	470,228 (40%)	353,218 (30%)	160,775 (14%)
RLE Project Area	2.88	44,610	4,446 (10%)	16,263 (36%)	14,857 (33%)	9,044 (20%)

Households with income <$40,000	*988,729*	*25.9%*	*452,957*	*39%*	*20,710*	*46.4%*

Source: U.S. Census Bureau 2010; U.S. Census Bureau 2012 (data for disabled people only)

Average household size is greater in the project area than in the seven-county region and the City of Chicago, increasing the demand for multiple vehicles. In particular, residents in locations such as the Altgeld Gardens Housing complex and southwest Roseland have a much greater dependency on transit, with higher household size and lower number of vehicles available per household. Based on vehicle ownership, the City of Chicago shows a slightly higher transit-dependent population than the project area; however, it may be attributed to lifestyle choice versus automobile affordability in addition to greater access to public transportation.

Compared to the seven-county region and the City of Chicago, the project area has a greater concentration of elderly and disabled populations. More information on sensitive populations is available in the *Environmental Justice Technical Memorandum*.

Based on the socioeconomic indicators presented in this section, the RLE project area generally has higher transit dependency than the overall Chicago region. The closest rapid transit rail station is at the northern edge of the project area (CTA's 95th Street Terminal) requiring long trips to access the rapid transit rail system. As further discussed in **Sections 5.1 and 5.3**, average travel time for work trips are higher in the project area than in the seven-county region due to traffic congestion and the time required to ride a bus to the 95th Street Terminal and transfer to the Red Line. The combination of these conditions underscores the need for improved connectivity and access to more efficient modes of travel.

5.3 Isolation from Major Activity Centers and Limited Viable Transportation Options

5.3.1 Existing Transportation Options

Despite the substantial amount of roadway infrastructure in the project area, expressways and arterial streets frequently become congested, limiting mobility. Mobility is further inhibited by the limited options for connecting to the CTA's rail system. Although bus routes operated by CTA and Pace provide service 24 hours a day, buses in the project area are frequently delayed by congestion on arterial streets leading to the 95th Street Terminal. None of the Red Line stations along the Dan Ryan branch currently have park & ride facilities, precluding residents from accessing the stations by car unless they are dropped off. Several bus routes serve the 95th Street Terminal and Metra stations; however, the large residential tracts surrounded by local streets limit the bus network. **Figure 5-5** shows the existing bus routes and rail lines in the project area.

Figure 5-5: Existing Public Transportation in the Red Line Extension Project Area

The Metra Rock Island District commuter rail line has two stations at the west end of the project area at 95th Street and 103rd Street. The Metra Electric District Mainline has four stations from 103rd Street to 115th Street and the Metra Electric Blue Island Branch has five stations from Ashland Avenue to State Street. Although it is unaffected by automobile congestion, Metra service is infrequent, and some stations, including both of the Rock Island District stations, have no mid-day or weekend service. Metra service is useful for peak-hour commuters traveling to and from downtown Chicago, but less convenient for off-peak travel or for non-downtown commutes that may require transferring to the CTA network. The Northern Indiana Commuter Transportation District does not have a station in the project area.

While the project area does have an extensive sidewalk and crosswalk system along the road network, physical divisions between communities include the ME mainline, which is on an embankment; Lake Calumet; the Little Calumet River; and the UPRR right-of-way, which extends north-south from 99th Street to 119th Street; and large tracts of industrial land. These physical divisions are difficult to cross for pedestrians and bicyclists, and effectively separate the communities on either side. This geographic isolation is particularly problematic for residents of the Altgeld Gardens public housing project at the south end of the project area between 130th Street and 134th Street in the Riverdale community area. Residents in this area have limited employment opportunities and transportation choices within walking distance of their homes. The project area currently has limited bicycle infrastructure although improvements are planned. The off-street bicycle trail, the Major Taylor Trail, extends southeast from 105th Street and Throop Street to the Whistler Woods Forest Preserve, south of the Little Calumet River in Riverdale. Bicycle lanes in the project area include the following:

- 103rd Street – From Michigan Avenue to Cottage Grove Avenue - Standard Bicycle Lanes
- State Street - From 95th Street to 99th Street - Standard Bicycle Lanes
- State Street - From 99th Street to 103rd Street - Marked-Shared Bicycle Lanes
- Vincennes Avenue - From 89th Street to 103rd Street - Barrier-Protected Bicycle Lanes
- Woodlawn Avenue - From 103rd Street to 111th Street - Standard Bicycle Lanes
- Vincennes Avenue - From 103rd Street to 105th Street “Future 2015” Buffer - Protected Bicycle Lanes
- 105th Street - From Vincennes Avenue to Major Taylor Trail - “Future 2015” Marked Shared Lanes
- Cottage Grove Avenue - From 93rd Street to 115th Street - “Future 2015” Buffer-Protected Bicycle Lanes

There is a need for additional transportation options to address the shortcomings in roadway, transit, pedestrian, and bicycle infrastructure in the project area. More information on existing travel patterns in the project area is available in the *Transportation Technical Memorandum*.

5.3.2 Affordable Housing Options

Residential houses in the project area had an estimated median value of $95,000 compared to $161,000 for the City of Chicago (2013 dollars). The median monthly rental price (for 2012) in the project area is estimated at $1,237 compared to $1,501 for the City of Chicago (Zillow 2012a, 2012b).

An example of vacant affordable housing in the project area is Altgeld Gardens, one of the country's first public housing complexes, where approximately 3,500 residents currently reside in 1,500 housing units (Altgeld Gardens, 2013). Given the age of the complex, several of the vacant units require rehabilitation before they can be inhabited. As a result, the Chicago Housing Authority (CHA), supported by a $265 capital improvement program, will rehabilitate 218 units in fiscal year 2015 (CHA 2014). As with other affordable housing opportunities in the project area, residents at Altgeld Gardens are challenged by the affordable housing/transit availability mismatch, in that housing in the project area is affordable but the commute time and effort required to reach viable employment areas are high. Given CHA's investment at Altgeld Gardens, the proposed project has the opportunity to result in a mutual benefit by leveraging the rehabilitation of the housing units and providing a viable transportation option thereby further off-setting the housing/transit availability mismatch.

There is a high percentage of vacant homes in the project area—13 percent higher than the City of Chicago (CMAP 2012). Several factors contribute to housing vacancy rates in a particular community. These factors include, but are not limited to, safety and security, proximity to public services, access to jobs, quality of schools, age and type of available housing units, quality of life, and the overall health of the community. Improved public transportation options, combined with affordable housing stock, would serve as a catalyst to bring people to the area that would not otherwise consider communities in the project area as a viable place to live. The mutual benefit for project area residents, and those seeking affordable housing, could be met through rapid transit south of the 95th Street Terminal. See **Figure 5-6** for affordable housing locations in the project area.

5.3.3 FTA Regulatory Framework

In August, 2013, FTA published the final rule implementing changes to the New Starts/Small Starts program. This rule is known as the *Moving Ahead for Progress in the 21st Century Act* (known as "MAP-21"). The program is focused on measuring a wider set of project benefits and streamlining the project evaluation process. Under Map-21, "land use" is a quantitative evaluation of several measures, including the share of legally binding affordable housing in the corridor.

In addition to the Map-21 evaluation of affordable housing, the U.S. Department of Housing and Urban Development, the U.S. Department of Transportation, and the U.S. Environmental Protection Agency joined together to form the Partnership for Sustainable Communities. This interagency partnership helps communities nationwide to improve access to affordable housing, increase transportation options, and lower transportation costs while protecting the environment.

The partnership agencies incorporated six principles of livability into federal funding programs, policies, and future legislative proposals:

- Provide more transportation choice.
- Promote equitable, affordable housing.
- Enhance economic competitiveness.
- Support existing communities.
- Coordinate and leverage federal policies and investment.
- Value communities and neighborhoods.

Each of the livability principles identified above are key elements of this project area. More transportation options and improved access to affordable housing would enhance livability in the project area.

5.4 Underserved Transit Markets and Limited Transit Connectivity

CTA and Pace bus services are provided on the east-west and north-south thoroughfares with 16 CTA and 6 Pace routes operating in the project area (not including night bus routes). Of those 22 total bus routes, 18 serve the 95th Street Terminal on the Red Line. **Table 5-6** summarizes existing bus routes, average bus ridership, and routes that serve the 95th Street Terminal. Currently the 95th Street Terminal serves as the only point of connection between CTA and Pace buses.

Metra service in the project area includes the Rock Island District, Electric District Mainline, and Electric District Blue Island Branch. The Northern Indiana Commuter Transportation District (NICTD) operates the South Shore Line, which shares tracks with the Metra Electric District Mainline north of 115th Street. Neither Metra nor NICTD connect to the 95th Street Terminal.

Table 5-6 demonstrates the demand for access to the 95th Street Terminal and the Red Line.

Table 5-6: Chicago Transit Authority Ridership Summary

Route Number and Name	2014 Average Weekday Ridership	Maximum Monthly Average Weekday Ridership (May 2012 to April 2013)[3]	Serves 95th Street Terminal[5]
#3 King Drive	19,224	21,125	No
#8A South Halsted	3,238	3,784	No
#9 Ashland[1]	26,871	29,066	Yes
#28 Stony Island	7,208	8,014	No
#29 State	13,342	14,012	Yes

#381 95th Street	4,038	4,593	Yes
#395 CTA 95th - UPS	529	669	Yes

Source: CTA 2014

Notes:

1. #9 Ashland serves the 95th Street Terminal only with the Night Owl Service.
2. Only January through April 2013 is shown for bus routes #111 and #115 due to a route change in December 2012.
3. Maximum monthly average weekday ridership is based on the 12-month period from May 2012 through April 2013. In May 2013, Red Line (Dan Ryan) reconstruction changed ridership patterns during construction.
4. Night service route #N5 is not included in this table.
5. Service to the 95th Street Terminal is based on route maps current as of July 31, 2013.

A potential transit travel market that is not currently well served is drive-access transit trips from within and south of the project area. There are no CTA park & ride facilities on the existing Red Line Dan Ryan branch. All of the other CTA rail rapid transit branches, with the exception of the Green Line Lake Street branch, have park & ride facilities. CTA's newest rail rapid transit line, the Orange Line (opened in 1993), has park & ride facilities at five of eight stations. The Blue Line has park & ride facilities at Rosemont and Cumberland stations, conveniently located near the I-90 Kennedy Expressway. A previous survey at these Blue Line park & ride stations found that passenger access CTA rail by car from 93 suburbs; 74 percent of all trips originated in the northwest suburbs or northwest Chicago (CTA 1994). Similar conditions, such as crowded expressways and expensive parking in the Loop, face travelers from southern Cook County and beyond. CTA park & ride facilities near major expressways or arterial streets in the southern portions of the project area, would provide new, convenient drive access possibilities on the Red Line.

Other potential transit travel markets include reverse commute trips, school trips, and home-based other trips within southern communities. Several educational facilities are in the project area, including Chicago State University (7,200 students), Olive-Harvey College (4,300 students), and several high schools (including Harlan, Corliss, Fenger, Julian, Brooks, and Carver High Schools) that would benefit from transit improvements in the project area.

Transportation equity is the fair distribution of transportation resources so that no group carries an unfair burden of the negative environmental, social, or economic impacts, or receives an unfair share of benefits. The project area population is almost entirely minority. Many residents do not have access to an automobile and rely on transit for mobility. In addition, daily parking costs in downtown Chicago are among the highest in the United States, further limiting the project area population's access to downtown. Transit improvements in the project area would serve all transportation system users, including low-income and underrepresented populations, and would provide better access to affordable housing in the project area.

5.5 Disinvestment and Limited Economic Development Have Affected Far South Side Communities

The project area has had ongoing disinvestment, including loss of manufacturing jobs, which has led to a decline in population, services, and job opportunities. Once-vibrant retail districts, such as Michigan Avenue and Halsted Street, now contain vacant land and storefronts. This decline may be seen in decreases in project area population and employment compared to the City of Chicago and the seven-county region (see **Table 5-7** and **Table 5-8**).

Table 5-7: Population Decline in Red Line Extension Project Area (2000 to 2010)

Area	2000 Population	2010 Population	Percent Change
Seven-County Area	8,146,264	8,399,893	3.02%
City of Chicago	2,895,964	2,700,741	-7.23%
RLE Project Area	147,662	128,366	-15.03%

Source: U.S. Census Bureau 2010

Table 5-8: Employment Decline in Red Line Extension Project Area (2000 to 2010)

Area	2000 Employment[1]	2010 Employment[1]	Percent Change
Seven-County Area	4,083,530	4,429,414	8.49%
City of Chicago	1,358,054	1,410,294	3.84%
RLE Project Area	62,587	56,105	-11.50%

Source: U.S. Census Bureau 2010

The City of Chicago is focusing on stabilizing, improving, and redeveloping communities in and adjacent to the project area. As a result, the City has designated several tax increment financing (TIF) districts, Redevelopment Areas (RA), Special Service Areas (SSAs), and Industrial Corridors in the project area. Major incentive zone areas in the project area include the following:

- 119th/Halsted Mixed-Use Area
- Roseland/Michigan Avenue Mixed-Use Area
- West Pullman Industrial Park Mixed Use Area
- North Pullman Mixed-Use Area
- 105th/Vincennes Mixed-Use Area
- 87th/Cottage Mixed-Use Area
- 119th & I-57 Redevelopment Area
- 107th/Halsted Mixed-Use Area
- Calumet Commercial Area
- Lake Calumet Indiana Industrial Corridor
- Stoney Island/Burnside Industrial Area
- SSA#40 Michigan Avenue/Roseland
- SSA #41 103rd Street/Roseland
- SSA $45 103rd Street/Halsted

In addition to economic revitalization initiatives, viable transportation options continue to be a key element in the success of economic development efforts and revitalization for communities within the project area. Examples of redevelopment in the project area include the Pullman District, the Method factory, and Walmart opening a store in 2014.

Located in the project area and referred to as the Pullman community area of Chicago, the Pullman District includes the Pullman factory, the Hotel Florence, and the Pullman Railroad Porters National Museum. This district was named a National Monument on February 19, 2015, making it a component of the National Park System. (Ward 9 Website 2015)

Building on the Pullman's community history as a manufacturing hub, Method, a manufacturer of environmentally-friendly cleaning and personal care products, has announced the opened a new 150,000 square foot factory in Pullman in April 2015. The Community Development Commission approved $8.1 million in tax increment financing for infrastructure improvements in Pullman Park in support of the Method plant construction. The plant has created approximately 100 jobs with good salaries, giving employees the opportunity to buy a home, raise a family, and build a financially secure future (Method 2015).

Bringing rail transit to an area that has not experienced recent growth may not only directly improve mobility for community residents, but it may also promote business and real estate investment confidence through the permanency of the improvement. The realization by investors that the rail infrastructure is a permanent enhancement in the area, and would provide better regional connectivity, may promote redevelopment and economic stabilization in the area. A local example is CTA's Brown Line Capacity Expansion Project where median home values near the Brown Line grew more than 40 percent between the years 2000 and 2011; the same time transit improvements where implemented in the corridor. Moreover, a Chicago-based economic development research organization determined that for every dollar spent on transit operating and capital expenses, the Chicago area will realize a return on investment of at least $1.21 and as much as $1.64. (Chicago Metropolis 2020 2007)

5.6 The Need for a Rail Car Storage Yard and Maintenance Facility

The existing 98th Street Yard does not have capacity to store rail cars required for any substantial increase in Red Line capacity accompanying future Red Line expansion. Two yard and shop facilities, Howard Yard at the north end of the Red Line and 98th Street Yard at the south end of the Red Line, provide storage for vehicles operating along the Red Line. Any Red Line expansion must consider the capacity of both yards. (The Howard Yard and the 98th Street Yard together supply rail cars for both the northern and southern portion of the Red Line.) All northbound trains currently begin their run at 98th Street Yard, and any expansion of Red Line service would require expanded yard capacity at or near the southern end of the Red Line. The existing 98th Street Yard in landlocked between interstate ramps for I-94 and I-57. There is no room to expand the yard without major realignments for the two highways. In addition, the existing 98th Street Yard is oriented as a terminal yard for service to and north of the 95th Street station. With the RLE Project expanding service to the south, use of the 98th Street Yard would lead to inefficient operations. Moving trains into and out of the existing yard, due to the orientation of the yard, would cause operational inefficiencies and potential capacity constraints to Red Line service.

Section 6
Project Goals

The goals for the RLE Project were developed, reviewed, and defined during CTA's RLE Alternatives Analysis. The goals, which helped define the evaluation criteria used in screening potential alternatives, are included in **Table 6-1**.

Table 6-1: Goals of the Red Line Extension Project Area

Goal	Objectives	Description
Goal 1	Reduce Travel Times	Reduce travel times for residents from within and south of the project area to the 95th Street Terminal and the Loop. Provide direct access to the CTA rail system for transit-dependent populations. Provide new stations convenient to transit-dependent communities. Provide direct service to public housing such as Altgeld Gardens.
Goal 2	Increase Travel Choices	Provide better transit access to regional employment centers and local commercial areas. Allow for potential connections to other public transportation modes including regional commuter rail. Reduce geographic isolation of the project area and improve connections to major activity centers. Provide opportunities for drivers commuting on expressways to park and use transit to complete their trips.
Goal 3	Increase Economic Competitiveness	Foster economic development in the project area by providing stations that can encourage nearby development.
Goal 4	Environmental Criteria	▪ Displacement and relocation impacts ▪ Noise Impacts ▪ Park Impacts ▪ Community Character Impacts ▪ Visual and Aesthetic Impacts
Goal 5	Provide the Best Value	▪ Projected ridership ▪ Capital costs to construct the project ▪ Changes in operating and maintenance costs for the system

Section 7
Conclusions

To meet the project needs identified in CTA's RLE Alternatives Analysis document and in response to the stated project goals above, the RLE Project is being proposed to reduce commute times, improve transit service, increase transportation choices, and promote economic development. The project is needed to respond to the limited transit choices, limited employment options, the need for connectivity to affordable housing, and the need to reverse disinvestment for communities on the Far South Side of Chicago. The purpose and need describes CTA's basis for advancing the proposed project and identifies objectives that frame the development and evaluation of the alternatives in the Draft EIS.

NEPA	National Environmental Policy Act
NICTD/CSS & SBRR	Northern Indiana Commuter Transportation District Chicago South Shore & South Bend Railroad
RLE	Red Line Extension
ROW	Right-of-Way
TIP	Transportation Improvement Program
UPRR	Union Pacific Railroad

Section 1
Background Information

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the 95th Street station to the vicinity of 130th Street, subject to the availability of funding. The proposed Red Line Extension (RLE) would include four stops. Each stop would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. Figure 1-1 shows the project area.

The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) will focus on the following alternatives that emerged from the Alternatives Analysis and National Environmental Policy Act (NEPA) scoping process, which are shown in Figure 1-2:

- No Build Alternative
- Bus Rapid Transit (BRT) Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 1-2: RLE Project Alternatives

This technical memorandum defines the four different alternatives (note: one alternative has three options) to be evaluated in the Draft EIS for potential environmental, economic, and social impacts. Each alternative will be described based on infrastructure improvements, stations, and operating plans.

Additional Information about the RLE Project

- The Dan Ryan branch of the Red Line (Cermak-Chinatown station to 95th Street station) opened for service in September 1969.
- In late 2006, CTA initiated an Alternatives Analysis study to identify and evaluate potential major fixed guideway transit solutions in the project area.
    - Community meetings to share the results of the Screen 1 process were held on April 10 and 11, 2007.
    - Community meetings to share the results of the Screen 2 process were held on December 3 and 4, 2008.
    - Community meetings to share the results of the Screen 3 process were held on June 3 and 4, 2009.
- On August 12, 2009, the UPRR Rail Alternative was designated by the Chicago Transit Board as the Locally Preferred Alternative.
- The NEPA scoping process occurred in 2009 with an agency scoping meeting held on September 24, 2009. Public scoping meetings were held on September 22 and 24, 2009. A Notice of Intent was published in the Federal Register on September 1, 2009.
- An Open House meeting to inform the public of progress on the RLE Project was held on August 2, 2011.

Updated July 29, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix A of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix A supersedes information presented in other chapters of this technical memorandum.

Section 2
No Build Alternative

NEPA requires analysis of the No Build Alternative. Comparison with the build alternatives helps to assess the relative benefits and impacts of the other alternatives being evaluated. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative. The bus routes assumed to be part of the No Build Alternative are illustrated in Figure 2-1.

The No Build Alternative is defined as the existing transportation system plus any committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP). Table 2-1 lists the TIP projects within the project area, which consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities.

Improvements to the 95th Street Terminal are anticipated to be completed prior to construction of the RLE. While specific details on the improvements are not yet available, major renovations and expansions to the station house are aimed at providing more space and improving the walking flow of passengers, with new or expanded bus terminal facilities—as well as Red Line platform improvements. Included in the upgrades are the following:

- New station building with bright, airy spaces and clear sightlines
- Expanded platforms to provide more room and easier flow of passengers
- Station will be largely enclosed in glass for maximum light and protection from the elements
- Wider bus lanes and increased spacing between bus bays to reduce congestion
- Wider sidewalks and waiting areas in bus terminal for increased passenger comfort and safety
- Sound panels at platform level to provide a more comfortable, less noisy space
- Additional escalators and elevators
- Additional space in front of ticket vending machines and fare gates

All elements of the No Build Alternative are included in each of the other alternatives.

Figure 2-1: No Build Alternative

Table 2-1: Northbound Travel Times for No Build Alternative

Route Segment	Travel Time (minutes)
130th to 95th Street Station	28.0
130th to Jackson Station	57.0
130th to Clark/Division Station	64.5
130th to Howard Station	93.5

2.1 Infrastructure

No new infrastructure would be constructed as part of the No Build Alternative other than projects already committed through the CMAP TIP and regular maintenance of existing track and structures.

2.2 Stations

No stations would be constructed as part of the No Build Alternative.

2.3 Yard

The 98th Street yard and shop at the south end of the existing Red Line would continue to be used for Red Line trains. The 98th Street yard and shop would need to be replaced as it is past its useful life.

2.4 Operating Plan

As part of the No Build Alternative, bus transit service would be focused on the preservation of existing services and projects. Bus routes in the project area are not expected to change as part of the No Build Alternative. The following bus routes (shown in Figure 2-1) run in the project area: #8A, #9, #30, #34, #103, #106, #108, #111, #112, #115, #119, #348, #352, #353, and #359.

Red Line travel times during the morning peak period for the No Build Alternative are presented in Table 2-2.

Table 2-2: 2010-2015 CMAP TIP Projects in the Project Area; Projects Assumed in No Build Alternative

Agency	Location	Project	Expected Completion Date
Illinois Department of Transportation (IDOT)	I-94 Bishop Ford Expressway from Stony Island feeder includes Blue Island	Repair/replace two bridges	2016
IDOT	Bridge over I-94 Bishop Ford Expressway at 111th Street	Repair bridge	2013
IDOT	I-57 from US 30 (Lincoln Highway) to I-94 (Dan Ryan Expressway /Mainline)	Repair bridge	2013
Chicago Department of Transportation (CDOT)	95th Street from Western Avenue to Ewing Avenue	Coordination of traffic signal timing	2016
IDOT	Vermont Street from Western Avenue to 127th Street	Resurface road	2013
IDOT	IL 1 (Halsted Street) from 127th Street to 152nd Street	Resurface road	2013
Metra	Regionwide	Acquire shop facility and/or equipment; work on rail tower or yard; work on vehicle maintenance facility	2016
IDOT	Bike Facility: Palos Heights-Cal Sag Multi-Use Greenway from Centennial Trail to Burnham Greenway	Build bicycle and pedestrian facility	2014
IDOT	Hotel Florence from 11111 South Forestville Pullman Historic District	Preserve historic facility	2012
IDOT	North Pullman Historic District Area	Conduct landscaping, preserve historic facility	2013

Section 3
BRT Alternative

The proposed transportation system management alternative is a 5.5-mile long Bus Rapid Transit (BRT) route, which would operate between the existing 95th Street station and the intersection of 130th Street and Eberhart Avenue via 95th Street, Michigan Avenue, 127th Street, Indiana Avenue, and 130th Street. Four stops with improved bus shelters would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements will not continue south of the 130th Street stop, the bus route will continue through Altgeld Gardens with stops at 131st Street and Langley Avenue, 131st Street and Corliss Avenue, 131st Street and Ingleside Avenue, 132nd Street and Ellis Avenue, 133rd Street and Ellis Avenue, and 133rd Place and Corliss Avenue. Figure 3-1 shows the BRT Alternative. Table 3-1 summarizes the streets on which the BRT Alternative would operate.

Table 3-1: BRT Alternative Street Summary

Street	Street Width (feet)	Number of Lanes	Center Turn Lane	Parking
95th Street	80	4	Yes	No
Michigan Avenue	40	2	No	Yes
127th Street	40	4	No	No
Indiana Avenue	40	4	No	No
130th Street	60	4	Yes	No

The BRT Alternative would incorporate bus routing changes that may occur as part of improvements to the 95th Street Terminal. The routing shown on the BRT Plans and Profiles reflects the existing station design. Routing will be adjusted when terminal is renovated.

3.1 Infrastructure

Projects already committed through the CMAP TIP would be constructed as described for the No Build Alternative. Regular maintenance of existing track and structures would continue.

No dedicated bus lanes would be provided for the BRT Alternative. Parking lanes would be removed for some portions of the alignment.

Figure 3-1: BRT Alternative

3.2 Stops and Parking

Improved bus shelters would be provided at the 103rd Street, 111th Place, Kensington Avenue, and 130th Street stops. Park & ride facilities with a total capacity of 700 parking spaces in the year of construction and up to 2,800 parking spaces in a later year (2030) would be constructed at the stop locations, as shown in Table 3-2.

Table 3-2: BRT Alternative Park & Ride Facility Parking Spaces

Location	Construction Year	Horizon Year (2030)
103rd Street	100	200
111th Street	100	200
Kensington Avenue	100	1,000
130th Street	400	1,400
Total	700	2,800

3.2.1 103rd Street Stop

Improved bus shelters for the 103rd Street stop would be on the northwest corner (nearside) of the 103rd Street and Michigan Avenue intersection for the southbound bus and at the northeast corner (farside) of the 103rd Street and Michigan Avenue intersection for the northbound bus. There are existing bus stops at these locations for CTA routes #34 and #119.

A surface parking lot with capacity for 200 spaces would be located on the southeast quadrant of the 102nd Street and Michigan Avenue intersection. The driveway for the parking lot would be on the west side of the lot, directly across from 102nd Place, onto Michigan Avenue.

3.2.2 111th Street Stop

Improved bus shelters for the 111th Street stop would be on the southwest corner (farside) of the 111th Street and Michigan Avenue intersection for the southbound bus and either the northeast or southeast corner (nearside or farside, respectively) of the 111th Street and Michigan Avenue intersection for the northbound bus. There are existing bus stops at these locations for CTA routes #34 and #119.

A surface parking lot with capacity for 200 spaces would be located on the southeast quadrant of the 111th Place and State Street intersection. Driveways for the parking lot would be on the north side of the parking lot, midway between State Street and Michigan Avenue, onto 111th Place, and on the south side of the parking lot, midway between State Street and Michigan Avenue, only 112th Street.

3.2.3 Kensington Avenue Stop

Improved bus shelters for the Kensington Avenue stop would be on the northwest corner (nearside) of the Kensington Avenue and Michigan Avenue intersection for the southbound bus and at the southeast corner (nearside) of the Kensington Avenue and Michigan Avenue intersection for the northbound bus. There are existing bus stops at these locations for CTA routes #34 and #119.

A three-story parking garage with capacity for 1,000 spaces would be located on the southeast quadrant of the Kensington Avenue and Michigan Avenue intersection; the ground level of the parking garage would be available for retail and/or community facilities. Driveways for the parking garage would be on the west side of the parking structure, midway between Kensington Avenue and the railroad crossing, onto Michigan Avenue, and on the south side of the parking structure, midway between Indiana Avenue and the railroad crossing, onto 116th Street.

3.2.4 130th Street Stop

Improved bus shelters for the 130th Street stop would be on the southwest corner (nearside) of the 130th Street and Eberhart Avenue intersection for the southbound bus and at the northwest corner (farside) of the 130th Street and Eberhart Avenue intersection for the northbound bus. A signalized intersection with crosswalk is proposed at the 130th Street and Eberhart Avenue intersection.

A three-story parking garage with capacity for 1,400 spaces would be located on the northwest quadrant of the 130th Street and Water Treatment Plan Access Road intersection. Driveways for the parking garage would be on the south side of the parking lot, adjacent from Eberhart Avenue, onto 130th Street, and on the east side of the parking lot, onto the Water Treatment Plant Access Road.

3.2.5 Additional Stops

Although BRT service elements will not continue south of the 130th Street stop, the bus route will continue through Altgeld Gardens along the existing #34 route with stops at 131st Street and Langley Avenue, 131st Street and Corliss Avenue, 131st Street and Ingleside Avenue, 132nd Street and Ellis Avenue, 133rd Street and Ellis Avenue, and 133rd Place and Corliss Avenue. Existing bus shelters will remain unchanged.

3.3 Yard

The existing 103rd Street Garage at 1702 103rd Street would be used to store BRT Alternative buses.

3.4 Operating Plan

The BRT Alternative would add a limited-stop enhanced bus route, #X34, along the existing #34 South Michigan Avenue bus route to 130th Street. The BRT Alternative would utilize traffic signal priority at signalized intersections along 95th Street, Michigan Avenue, and 130th Street.

The BRT Alternative would require a net increase of 12, 60-foot articulated buses plus two spares.

The BRT Alternative bus would run 24 hours per day. Bus frequencies would be adjusted during peak periods to a four-minute frequency between 6 AM and 8 PM on weekdays and a 12-minute frequency on the existing route #34 to better serve anticipated demand.

Table 3-3 presents the proposed travel times during the morning peak period for the BRT Alternative via route #X34 and the Red Line.

Table 3-3: Northbound Travel Times for BRT Alternative

Route Segment	Travel Time (minutes)
130th Street to 95th Street Station	23.0
130th Street to Jackson Station	52.0
130th Street to Clark/Division Station	59.5
130th Street to Howard Station	88.5

Section 4
UPRR Rail Alternative

The proposed UPRR Rail Alternative would extend the heavy rail transit Red Line from the existing 95th Street Station to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting.

The UPRR Rail Alternative is a 5.3-mile extension of the existing Red Line. The trains would operate on an elevated structure heading south from 95th Street along I-57 for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of Prairie Avenue, the alignment would cross over the Canadian National (CN)/Metra Electric tracks near 119th Street, where it would transition to an at-grade profile and then continue southeast along the Northern Indiana Commuter Transportation District Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) ROW using a portion of the Norfolk Southern Railway and Consolidated Rail Corporation ROW to terminate at 130th Street. Four stations would be included at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Figure 4-1 shows the UPRR Rail Alternative.

Three UPRR Rail Alternative options for the segment between I-57 and the CN/Metra Electric tracks are studied in the EIS:

- ROW Option: CTA tracks placed in the UPRR ROW; UPRR trains would relocate to another corridor as part of a separate, earlier project that may occur regardless of RLE implementation. The City of Chicago is performing this separate, independent study to evaluate relocating the UPRR trains to another corridor.
- East Option: CTA tracks placed immediately adjacent to and east of the UPRR ROW.
- West Option: CTA tracks placed immediately adjacent to and west of the UPRR ROW.

Two options for the 130th Street terminal station are studied in the EIS:

- South Station Option: located to the west of the NICTD/CSS & SBRR ROW at 130th Street.
- West Station Option: located along the north side of 130th Street to the west of the NICTD/CSS & SBRR route.

Figure 4-1: UPRR Rail Alternative Options

4.1 Infrastructure

Projects already committed through the CMAP TIP would be constructed as described for the No Build Alternative. Regular maintenance of existing track and structures would continue.

All three UPRR Rail Alternative options would include operation on elevated structure from 95th Street to the CN/Metra Electric tracks near 119th Street. The alignment would then continue at grade through an industrial area with no public through streets. Existing service driveways and Metropolitan Water Reclamation District of Greater Chicago (MWRD) access roads would be grade separated as indicated on the plans and profiles.

The elevated substructure would consist of reinforced cast-in-place concrete hammerhead piers on drilled shafts or steel piles. The superstructure would consist of steel girders with a concrete closed deck supporting direct fixation track with welded rail.

Minimum vertical clearances would be 14 feet 9 inches. At locations where the RLE alignment would cross UPRR tracks, the minimum vertical clearance would be 23 feet 4 inches.

Spans between piers are expected to typically be 60 to 100 feet, and as long as 140 feet. Span length is based on site conditions, geometrics, and clearance requirements. Table 4-1 lists the clearances between piers at viaducts and Figure 4-2 shows a typical span.

Table 4-1: UPRR Rail Alternative Span Widths at Viaducts

Street Crossing	ROW Option (feet)	East Option (feet)	West Option (feet)	Notes
I-57 ramp	105	105	105	Straddle Bent
Wentworth Avenue	85	85	85	
Northbound I-57*	100/100	100/100	100/100	Straddle Bent
UPRR*	-	-	100/100	
101st Street	75	75	75	
103rd Street	85	85	85	
107th Street	75	75	75	
109th Street	75	75	75	
111th Street	75	75	75	
Wentworth Avenue	85	85	85	
115th Street	120	120	120	Through Plate Girder
Perry Avenue	-	-	85	
State Avenue	85	85	85	
Michigan Avenue	85	85	85	

Street Crossing	ROW Option (feet)	East Option (feet)	West Option (feet)	Notes

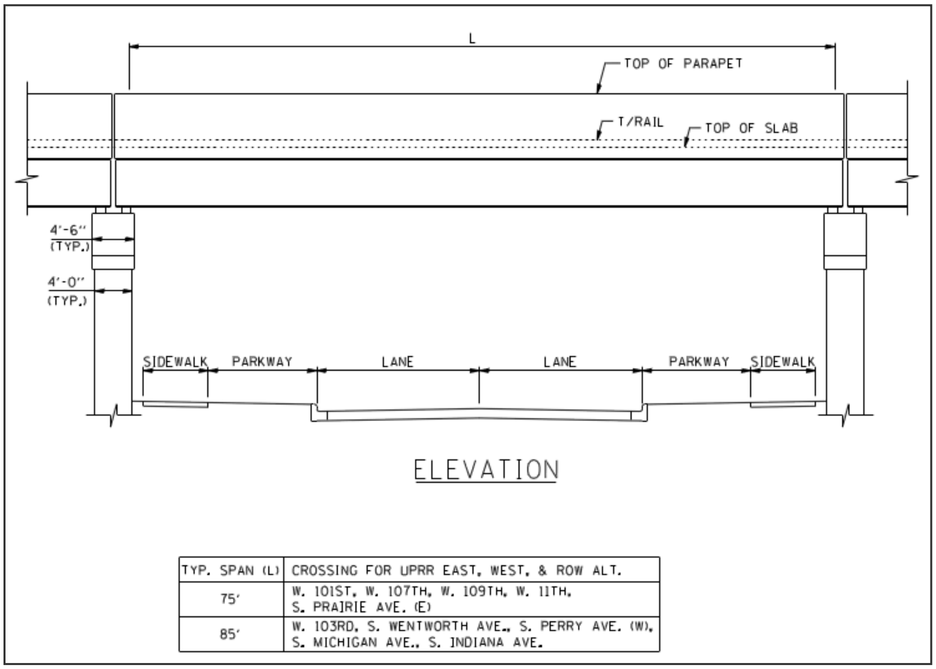
CN/Metra Electric	100/70	115/70	110/70	Through Plate Girder

*Crossings may have multiple spans due to skewed alignment and the use of bent structure

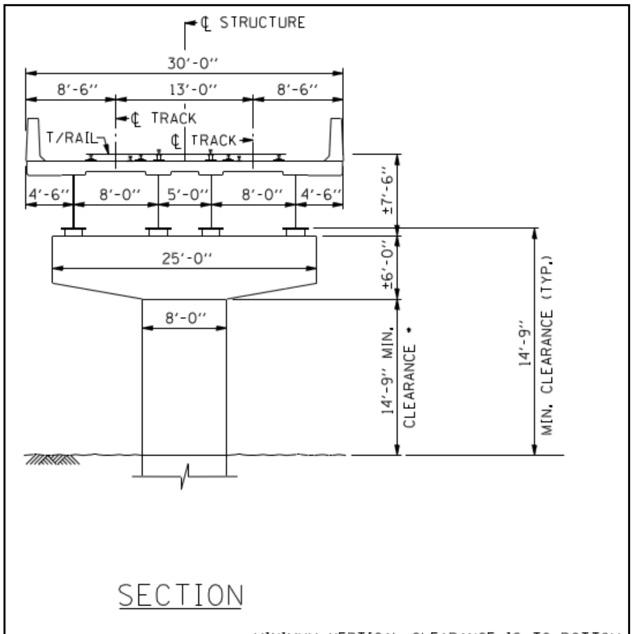


TYP. SPAN (L)	CROSSING FOR UPRR EAST, WEST, & ROW ALT.
75'	W. 101ST, W. 107TH, W. 109TH, W. 11TH, S. PRAIRIE AVE. (E)
85'	W. 103RD, S. WENTWORTH AVE., S. PERRY AVE. (W), S. MICHIGAN AVE., S. INDIANA AVE.

Figure 4-2: UPRR Rail Alternative typical span cross section

4.1.1 ROW Option

The UPRR Rail Alternative ROW Option would place the CTA tracks in the UPRR ROW between I-57 and the CN/Metra Electric tracks. UPRR trains along this alternative may relocate to another corridor as part of a separate, earlier project that would occur regardless of RLE implementation. Figure 4-3 shows a typical ROW Option cross section.



* MINIMUM VERTICAL CLEARANCE IS TO BOTTOM OF PIER CAP WHERE PIER CAP OVERHANGS TRAVELD ROADWAY.

Figure 4-3: UPRR Rail Alternative ROW Option Typical Cross Section

Substations are tentatively proposed at the following locations: to the west of the CTA tracks between 104th and 105th Street, to the west of the CTA tracks between Perry Avenue and Lafayette Avenue, and to the west of the CTA tracks north of the proposed parking structure for the South Station Option or along the curve of the CTA tracks near 130th Street for the West Station Option. An additional substation is proposed within the 120th Street yard and shop facility.

4.1.2 East Option

In the UPRR Rail Alternative East Option, CTA tracks would be placed immediately adjacent to and east of the UPRR ROW between I-57 and the CN/Metra Electric tracks. The UPRR is evaluating adding a third track to the east of their two existing tracks. The distance between the centerline of the proposed easternmost UPRR third track and the CTA structure would be 50 feet except for the following locations: 103rd Street station (approximate stationing 154+00 to 181+00 and between State Street and Michigan Avenue (approximate stationing 255+00 to 270+00). Pier protection crash walls per American Railway Engineering and Maintenance-of-Way Association (AREMA) would be installed in areas where the CTA tracks are less than 50 feet from the UPRR tracks. Figure 4-4 shows a typical East Side Option cross section.

Figure 4-4: UPRR Rail Alternative East Option Typical Cross Section

The UPRR Rail Alternative East Option would include substations at the following locations: west of the UPRR tracks between 104th and 105th Streets, west of the UPRR tracks between Perry Avenue and Lafayette Avenue, and west of the CTA tracks south of the proposed yard location near 130th Street station. An additional substation is proposed within the 120th Street yard and shop facility.

4.1.3 West Option

In the UPRR Rail Alternative West Option, CTA tracks would be placed immediately adjacent to and west of the UPRR ROW between I-57 on the north end and the UPRR tracks near Kensington Park on the south end. The distance between the UPRR centerline of existing west track and the proposed CTA structure centerline of track would be 50 feet except for the following locations: 99th Street (approximate stationing 138+00 to 142+00) and at the Prairie Avenue/UPRR crossing (approximate stationing 275+00 to 285+00).

The UPRR Rail Alternative West Option would include substations at the following locations: east of the UPRR tracks between 105th Street and 105th Place, west of the UPRR tracks between Perry Avenue and Lafayette Avenue, and east of the CTA tracks south of the proposed yard location near 130th Street station. An additional substation is proposed within the 120th Street yard and shop facility.

4.2 Stations and Parking

Four stations would be included in the UPRR Rail Alternative options: 103rd Street, 111th Street, Michigan Avenue, and 130th Street. One terminal station with two options is under evaluation for the 130th Street station: the South Station Option and the West Station Option.

All stations would be island platforms, 26 feet wide and 520 feet long. Platforms would be built to accommodate ten-car trains. All stations would be ADA accessible with elevators. Station footprints are depicted on the Plans and Profiles.

Bus and park & ride facilities would be placed at all stations, with capacities of 1,500 parking spaces in the year of construction and up to 3,700 parking spaces in a later year (2030), as shown in Table 4-2.

Table 4-2: UPRR Rail Alternative Park & Ride Faciliy Parking Spaces

Location	Construction Year	Horizon Year (2030)
103rd Street	200	200
111th Street	200	200
Michigan Avenue	200	1,000
130th Street	900	2,300
Total	**1,500**	**3,700**

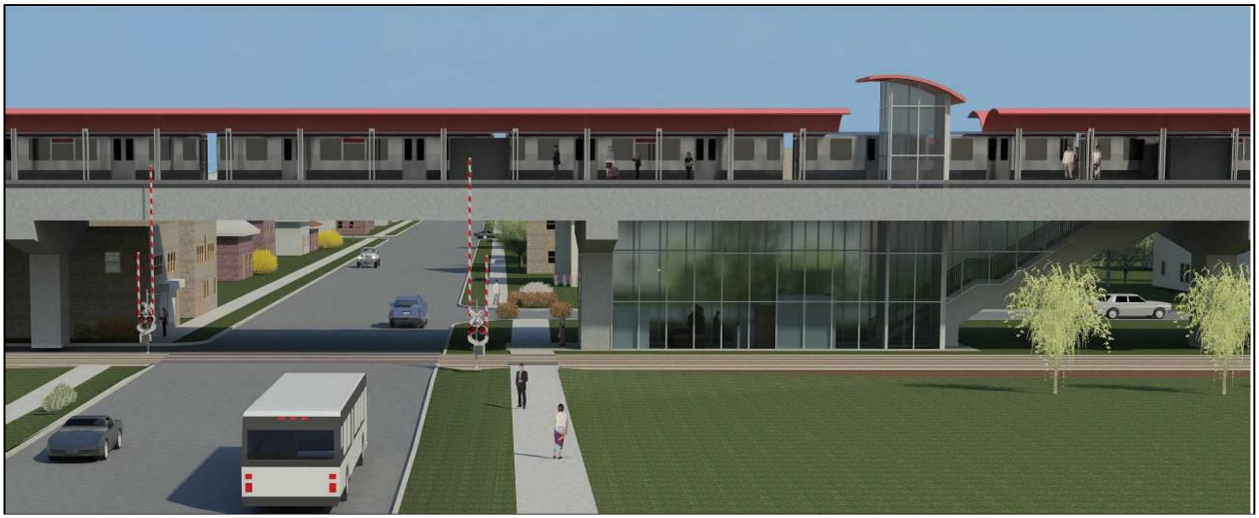
4.2.1 103rd Street Station

The primary entrance to the 103rd Street station would be on the north side of 103rd Street, and an auxiliary entrance would be on the north side of 103rd Place. Figure 4-5 shows an example rendering of the UPRR Rail Alternative elevated structure at the 103rd Street station.

As part of the ROW Option, two surface parking lots, each with capacity for 100 vehicles, would be located to the northeast and southwest of the intersection of 103rd Street with the UPRR tracks. A bus turnaround for CTA bus route #9 would be included at the northeast parking lot.

As part of the East Option, a surface parking lot with capacity for 75 vehicles would be located to the east of the tracks north of 103rd Street as well as a second surface parking lot with capacity for 125 vehicles located to the west of the tracks between 103rd Street and 103rd Place. A bus turnaround for CTA bus route #9 would be included at the northeast parking lot.

As part of the West Option, a surface parking lot with capacity for 200 vehicles would be located to the west of the tracks between 103rd Place and 104th Street. A bus turnaround for CTA bus route #9 would be included at the northeast corner of the 103rd Street and UPRR tracks intersection.



Source: *Locally Preferred Alternative Report, August 2009*

Figure 4-5: Example Rendering of the UPRR Rail Alternative Elevated Structure at the Proposed 103rd Street Station

4.2.2 111th Street Station

As part of the ROW and West Options, the primary entrance to the 111th Street station would be just north of 111th Street. An auxiliary entrance would be south of 110th Street.

As part of the East Option, the primary entrance to the 111th Street station would be just north of 111th Street. An auxiliary entrance would be at 110th Street.

As part of the ROW Option, two surface parking lots, each with capacity for 100 vehicles, would be located to the northeast and northwest of the intersection of 111th Street with the UPRR tracks. A bus turnaround for Pace bus route #352 would be included at the northwestern parking lot.

As part of the East Option, a surface parking lot with capacity for 55 vehicles would be located to the east of the tracks north of 110th Place, and a second surface parking lot with capacity for 145 vehicles located to the west of the tracks between 111th Street and 110th Street. A bus turnaround for Pace bus route #352 would be included at the northwestern parking lot.

As part of the West Option, a surface parking lot with capacity for 200 vehicles would be located to the west of the tracks between 110th Place and 110th Street. A bus turnaround for Pace bus route #352 would be included at the parking lot.

4.2.3 Michigan Avenue Station

As part of the ROW and West Options, the primary entrance to the Michigan Avenue station would be on the west side of Michigan Avenue, and an auxiliary entrance would be located on the south side of 116th Street.

As part of the East Option, a primary entrance to the Michigan Avenue station would be on the east side of Michigan Avenue. An auxiliary entrance would be on the north side of 116th Street.

As part of the ROW Option, a three-story parking garage with capacity for 750 vehicles would be located to the west of the tracks, northeast of the State Avenue and 116th Street intersection; the ground level of the parking garage would be available for retail and/or community facilities and would include a bus turnaround facility for CTA route #119 and Pace route #359. A second surface lot with capacity for 250 vehicles would be located to the east of the tracks, between 116th Street and Kensington Avenue.

As part of the East Option, a three-story parking garage with capacity for 825 vehicles would be located to the west of the tracks, northeast of the State Avenue and 116th Street intersection; the ground level of the parking garage would be available for retail and/or community facilities, and would include a bus turnaround facility for CTA route #119 and Pace route #359. A second surface lot with capacity for 175 vehicles would be located to the east of the tracks, between 116th Street and Kensington Avenue.

As part of the West Option, a five-story parking garage with capacity for 1,000 vehicles would be located to the west of the tracks, northeast of the State Avenue and 116th Street intersection; the ground level of the parking garage would be available for retail and/or community facilities, and would include a bus turnaround facility for CTA route #119 and Pace route #359.

4.2.4 130th Street Station

Two options for the 130th Street station will be studied in the EIS:

- South Station Option: along the NICTD/CSS & SBRR ROW at 130th Street
- West Station Option: along the north side of 130th Street to the west of the NICTD/CSS & SBRR route

The 130th Street station area is shown in Figure 4-6.

Figure 4-6: Station Area Showing South and West Station Options

The conceptual design for the station, based on Chicago Department of Transportation's December 2010 *130th Street Station Market/Access Study*, meets the needs for transit use, economic development, and connectivity to the proposed future pedestrian and bicycle trail network. The conceptual plans show a building approximately 15,000 square feet (200 feet by 75 feet), which would follow CTA's typical design standards for terminal stations. The station house would provide sufficient space for CTA customer operations, maintenance, mechanical rooms, staff offices, and areas for small retail stores. The retail area would primarily serve commuters and local residents.

Both the South and West Station Options would be configured with three tracks, creating a 600-foot long side and center platform arrangement. The boarding platform would be designed to allow for ten-car trains. The primary entrance to the station house would be handicap accessible.

Each station option would include a bus terminal with four bus bays and an overhead canopy. Buses would queue directly outside the primary entrance of the station to provide the closest possible connection between the rail line and bus routes. An auto drop-off area would be sited near the station house. Secure, weather-protected bicycle parking would be provided at the station. A park & ride facility with 2,300 parking spaces would be constructed by 2030 for the South Station Option, and a park & ride facility with 1,950 parking spaces plus a surface lot with 350 parking spaces would be constructed by 2030 for the West Station Option.

4.2.4.1 South Station Option

The South Station Option would be located between the MWRD facility (on the west) and the NICTD/CSS & SBRR rail tracks (on the east), using a portion of the Norfolk Southern Railway and Consolidated Rail Corporation right-of-ways. The concept plan shows a primary station entrance north of 130th Street at 130th Place, and an auxiliary entrance south of 130th Street between 130th Street and Doty Avenue; the tracks and platforms would extend beneath 130th Street. The handicapped-accessible auxiliary entrance on Doty Avenue would provide more convenient and direct access to Altgeld Gardens and Carver Military Academy.

The South Station Option site is constrained due to its tight location between the MWRD drying ponds and the train tracks. The parking area would be to the east of the existing MWRD fence. The parking area would be approximately 2.8 acres. In the construction year, a parking garage would be built with capacity for 900 vehicles. The parking garage would be developed into a seven-story parking garage with capacity for 2,300 vehicles by 2030.

The station area is significantly lower in elevation than 130th Street, which rises to cross the NICTD/CSS & SBRR tracks before crossing I-94. As a result, the station building would not be highly visible from the freeway or from cars travelling east towards the station entrance on Cottage Grove Avenue. The sloped areas adjacent to 130th Street limit the ability to place the South Option station house closer to the street.

Bus and vehicle traffic would enter and leave the station area from the current intersection of 130th Street and Cottage Grove Avenue. Cottage Grove Avenue, which primarily provides access to the MWRD drying ponds and truck traffic, would be relocated to circulate around the station. Ideally, transferring customers would not have to cross a general traffic lane to access bus transfer bays. Further refinement of this concept would likely eliminate general traffic from entering the parking lot near the station house. Currently, Cottage Grove Avenue intersects 130th Street at the same location as the proposed entrance to the South Option station. Cottage Grove Avenue would be relocated west of the station entrance. This would eliminate potential traffic conflicts between trucks servicing the MWRD facility and commuters entering the station. The new street alignment could also serve future commercial development along 130th Street.

4.2.4.2 West Station Option

The West Station Option would be located on the north side of 130th Street across from Evans Avenue, nearly ¼ mile west of the South Station Option location. The station would be west of Evans Avenue (on the south side of 130th Street) across from Altgeld Gardens. The West Station Option site is nearly twice the size of the South Station Option site, primarily due to available open land along the north side of 130th Street south of the MWRD facility. However, the dimensions of the station, bus terminal, and surface parking areas would be similar in total area as the South Station Option. The station area would be outside the existing MWRD fence. In the construction year, a surface lot would be constructed with capacity for 350 vehicles, and a parking garage would be built with capacity for 550 vehicles. The parking garage would be developed into a four-story parking garage with capacity for 1,950 vehicles by 2030.

There would be no intersections or crosswalks on 130th Street between Indiana Avenue and Cottage Grove Avenue. As a result, a signal and pedestrian crosswalk is proposed at the intersection of 130th Street and Evans Avenue to accommodate pedestrians from the south side of 130th Street. The proposed pedestrian crossing and signalized intersection would be located south of the primary station entrance.

4.3 120th Street Yard and Shop

A 270-car yard and shop facility would be sited on a combination of industrial/vacant land to the east of the CN/Metra Electric tracks and west of the NICTD/CSS & SBRR tracks at approximately 120th Street and Cottage Grove Avenue. The yard would be entirely at grade. A nominal amount of parking for employees would be included at the yard. A substation is tentatively proposed within the 120th Street yard on the west of the existing railroad tracks and to the east of the proposed shop facility. Figure 4-1 shows the proposed yard and shop location.

The 98th Street yard and shop at the south end of the existing Red Line could continue to be used for Red Line trains. The CTA would utilize the existing 98th Street shop for non-revenue equipment repairs once a new revenue shop is constructed.

4.4 Operating Plan

The UPRR Rail Alternative is anticipated to operate train sets consisting of eight cars. Although the design is for ten-car trains, the service plan is for eight-car trains as in operation today. The maximum scheduled capacity of each car is 90 passengers, which would provide a maximum capacity of 360 passengers for a four-car train, a maximum capacity of 720 passengers for an eight-car train, and a maximum capacity of 900 passengers for a ten-car train. The current Red Line vehicle requirement during the morning peak period is 304 cars. Based on the estimated travel time for the UPRR Rail Alternative, an additional 78 cars would be required in the morning rush period. This estimate includes 64 cars required for the schedule plus 14 spares.

CTA 2600-series rail cars are currently in use on the Red Line. As new CTA 5000-series rail cars replace older cars in the system, the cars currently operating on the Red Line could be replaced with CTA 5000-series or CTA 3200-series cars.

The hours of operation for the UPRR Rail Alternative would be the same as for the current Red Line, which operates 24 hours every day of the year. The UPRR Rail Alternative service frequency is expected to be the same as current service, which is approximately five minutes in the northbound direction and four minutes southbound during the morning peak period. Weekday service characteristics for the existing northbound Red Line and proposed UPRR Rail Alternative are presented in Table 4-3.

Table 4-3: UPRR Rail Alternative and Existing Northbound Red Line Weekday Service Characteristics

Service Period	Hours	Time Period	Average Northbound Frequency (minutes)	Train Length	Cars Required
Early Morning	3	3 AM-6 AM	13	8	
AM Peak	3	6 AM-9 AM	5	8	304
Base	6	9 AM-3 PM	7	8	184
PM Peak	3	3 PM-6 PM	5	8	304
Evening	4	6 PM-10 PM	7.5	4	
Late Evening/Owl	5	10 PM-3 AM	15	4	48

Proposed travel times during the morning peak period for the UPRR Rail Alternative are presented in Table 4-4.

Table 4-4: Northbound Red Line Travel Times for UPRR Rail Alternative

Route Segment	Travel Time (minutes)
130th to 95th Street Station	14.0
130th to Jackson Station	39.0
130th to Clark/Division Station	46.5
130th to Howard Station	75.5

Bus transit service from the south would serve the new stations. The UPRR Rail Alternative would result in the rerouting of 11 bus routes to new Red Line stations and elimination of two routes. Table 4-5 summarizes the proposed bus route changes to existing CTA bus routes that currently operate within the study area.

Table 4-5: Proposed Bus Route Changes for UPRR Rail Alternative

Bus Route	Proposed Change
#8A	None
#9	Terminate at 103rd Street station rather than 104th Street /Vincennes Avenue
#30	Terminate at 130th Street station rather than 130th Street /Exchange Avenue
#34	Terminate southbound at 130th Street station rather than 131st Street/Ellis Avenue
#103	Combine with #106; west terminal at Pulaski Avenue and east terminal at Stony Island Avenue
#106	Combine with #103; west terminal at Pulaski Avenue and east terminal at Stony Island Avenue
#108	Eliminate
#111	Serve 111th Street between 111th Street /Pulaski Avenue and 111th Street /Corliss Avenue
#112	Eliminate
#115	New bi-directional loop route via 115th Street, Cottage Grove Avenue, 95th Street, and Vincennes Avenue
#119	Terminate at 115th Street / Michigan Avenue
#348	Terminate southbound at 130th Street station rather than 136th Street /Indiana Avenue
#352	Terminate at 111th Street station rather than 95th Street station
#353	None
#359	Terminate at 115th Street station rather than 95th Street station

UPRR operates approximately 27 at-grade trains per day through this corridor. The potential exists for UPRR freight trains to affect access to the facilities in the UPRR Rail Alterative at the proposed 103rd Street and 111th Street stations. At these two stations areas, the UPRR is at-grade, so that passing freight railroad trains would interrupt access to the proposed Red Line stations. At the Michigan Avenue station, the UPRR is grade separated, so that access to the Red Line station could be maintained using Michigan Avenue, which passes underneath the UPRR.

Section 5
Halsted Rail Alternative

The proposed Halsted Rail Alternative is a five-mile extension of the existing Red Line. It would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. It would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. Four stations would be at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. Figure 5-1 shows the Halsted Rail Alternative.

5.1 Infrastructure

Projects already committed through the CMAP TIP would be constructed as described for the No Build Alternative. Regular maintenance of existing track and structures would continue.

The proposed corridor would be elevated and would be required to span over I-94 and I-57, UPRR and Metra Electric, local roads, and pedestrian facilities. See Figures 5-2 and 5-3 for typical cross sections of the Halsted Rail Alternative.

The proposed typical structure required for the elevated section is anticipated to be similar to sections on the CTA's elevated Orange Line. Spans between piers would typically be 60 to 100 feet, and as long as 140 feet. Span length would be based on site conditions, geometrics, and clearance requirements. At specific locations, steel cross girder bents would be used. Lengths would be based on geometrics, horizontal clearances, and the use of pier protection crash walls per AREMA. Table 5-1 shows the horizontal clearances between piers at viaducts.

The substructure would be reinforced cast-in-place concrete hammerhead piers on drilled shafts or steel piles. The superstructure would consist of steel girders with a concrete closed deck supporting direct fixation track with welded rail. At the I-57 crossing at Halsted Street the profile height would be approximately 22 feet over the Halsted Street pavement, and approximately 34 feet over the expressway.

Minimum vertical clearances would be 14 feet 9 inches above local roads and 16 feet 6 inches above urban expressways. At locations where the proposed CTA structure would cross the UPRR, the minimum vertical clearance would be 23 feet 4 inches, per the UPRR standards. The minimum vertical clearance for the Metra Electric tracks would be 23 feet zero inches per AREMA standards.

Substations are proposed at the following locations: the northeast corner at the intersection of Halsted Street and 101st Street, the southeast corner at the intersection of Halsted Street and 110th Street, along Halsted Street between 120th Street and Metra Electric tracks, the southeast corner at the intersection of Halsted Street and 126th Street, and at the entrance to the yard along Peoria Street.

5.2 Stations and Parking

This alternative would include four stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The 103rd, 111th, and 119th Street stations would be side platforms, with a minimum of 14 feet wide and 520 feet long with shelters. The Vermont Avenue station would be an island platform 26 feet wide and 520 feet long. Bus and park & ride facilities would be sited at all stations as shown in Table 5-2. All stations would be ADA accessible with elevators and stairs. Station footprints are depicted on the Plans and Profiles.

Table 5-2: Halsted Rail Alternative Park & Ride Facility Parking Spaces

Location	Construction Year	Horizon Year (2030)
103rd Street	200	200
111th Street	200	200
119th Street	200	1,000
Vermont Avenue	900	2,300
Total	1,500	3,700

5.2.1 103rd Street Station

Station entrances would be located on the east and west sidewalks of Halsted Street at the intersection with 103rd Street. The primary station entrance would be north of the intersection and the auxiliary entrance would be south of the intersection. Each entrance area would be on street level and contain an elevator and stairs.

The 103rd Street station would have a surface park & ride lot on the northwest parcel adjacent to the station at the intersection of 103rd Street and Halsted Street. This lot would provide approximately 200 parking spaces. A bus turnaround for CTA bus route #9 would be included at the northeast parking lot.

5.2.2 111th Street Station

Station entrances would be located on the east and west sidewalks of Halsted Street at the intersection with 111th Street. The primary station entrance would be north of the intersection and the auxiliary entrance would be south of the intersection. Each entrance area would be on street level and contain an elevator and stairs.

The 111th Street station would have a park & ride lot on the northwest parcel adjacent to the station at the intersection of 111th Street and Halsted Street. This lot would provide approximately 200 parking spaces.

5.2.3 119th Street Station

Station entrances would be located on the east and west sidewalks of Halsted Street at the intersection with 119th Street. The primary station entrance would be north of the intersection with 119th Street and the auxiliary entrance would be south of the intersection with 118th Street. Each entrance area would be on street level and contain an elevator and stairs.

The 119th Street station would have a surface park & ride facility that would hold approximately 1,000 parking spaces. The lot would be on the southwest parcel at the intersection of 119th Street and Halsted Street. A bus turnaround for Pace bus route #359 would be included at the parking lot.

5.2.4 Vermont Street Station

Station entrances would be located on the east and west sidewalks of Halsted Street between the 128th Street and Vermont Avenue. The primary station entrance would be south of Vermont Avenue and the auxiliary entrance would be north of 128th Street. Each entrance area would be on street level and contain an elevator and stairs.

The Vermont Street station would have a surface park & ride lot with approximately 300 parking spaces located to the east of Halsted Street between Vermont Avenue and 128th Street. A seven-story park & ride facility with capacity for an addition 2,000 vehicles would be located to the west of Halsted Street between Vermont Avenue and 128th Street; the ground level of the parking garage would be available for CTA office space as well as retail and/or community facilities. Bus bays for CTA bus route #8A and Pace routes #348 and #352 would be included at the station.

5.3 119th Street Yard and Shop

The 119th Street yard and shop would be located south of the 119th Street station and north of Vermont Avenue station to the west of Halsted Street. The parcel on which the yard and shop would be constructed sits west of the proposed park & ride facility at the 119th Street station. Track height would transition from elevated at station height to at-grade between Halsted Street and Morgan Street, through the proposed park & ride facility. The yard would be entirely at grade. A nominal amount of parking for employees would be included at the yard. Figure 5-1 shows the location of the proposed yard and shop.

The 98th Street yard and shop at the south end of the existing Red Line could continue to be used for Red Line trains. The CTA would utilize the existing 98th Street shop for non-revenue equipment repairs once a new revenue equipment shop is constructed at 119th Street.

5.4 Operating Plan

The Halsted Rail Alternative is anticipated to operate train sets consisting of eight cars. Although the design is for ten-car trains, the service plan is for eight-car trains as in operation today. The maximum scheduled capacity of each car is 90 passengers, which would provide a maximum capacity of 360 passengers for a four-car train, a maximum capacity of 720 passengers for an eight-car train, and a maximum capacity of 900 passengers for a ten-car train. The current Red Line vehicle requirement during the morning peak period is 304 cars. Based on the estimated travel time for the Halsted Rail Alternative, an additional 78 cars would be required in the morning rush period. This estimate includes 64 cars required for the schedule plus 14 spares.

CTA 2600-series rail cars are currently in use on the Red Line. As new CTA 5000-series rail cars replace older cars in the system, the cars currently operating on the Red Line could be replaced with CTA 5000-series or CTA 3200-series cars.

The hours of operation for the Halsted Rail Alternative would be the same as for the current Red Line, which operates 24 hours every day of the year. The Halsted Rail Alternative service frequency is expected to be the same as current service, which is approximately five minutes in the northbound direction and four minutes southbound during the morning peak period.

Bus transit service from the south would serve the new stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity between the Red Line and the existing bus network. Table 5-3 summarizes the proposed bus route changes to existing CTA bus routes that currently operate within the study area.

Table 5-3: Proposed Bus Route Changes for Halsted Rail Alternative

Bus Route	Proposed Change
#8A	None
#9	Terminate at 103rd Street station rather than 104th Street/Vincennes Avenue
#30	None
#34	None
#103	Combine with #106
#106	Combine with #103
#108	Eliminate
#111	Serve 111th Street between 111th Street/Pulaski Avenue and 111th Street/Corliss Avenue
#112	Eliminate
#115	New bi-directional loop route via 115th Street, Cottage Grove Avenue, 95th Street, and Vincennes Avenue
#119	Terminate at 115th Street/Michigan Avenue
#348	None
#352	Terminate at Vermont Avenue
#353	None
#359	Terminate at 119th Street

Appendix A
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

SHEET TITLE

Memorandum

To: *CTA, Sonali Tandon*

From: *CWC - Wight & Company*

Date: *January 6, 2015, revised March 16, 2015*

Subject: *Evaluation of Conceptual Red Line Extension Alignment*

Purpose

The purpose of this memo is to verify that the conceptual Red Line Extension (RLE) alignment meets certain minimum design criteria and to analyze the potential benefits or drawbacks of different variations of the two Union Pacific Railroad (UPRR) Alignments. Both the East and West Options have been checked for horizontal clearance and curves.

Verification #1: UPRR Horizontal Clearance

We checked the proposed alignment to verify that it would provide a minimum fifty foot horizontal clearance from the centerline of UPRR's future third track on east side of the UPRR corridor.

The minimum clearance distance is met along the entire East Alignment, with the exception of the following two locations:

- The proposed alignment would shift west to avoid an existing pump station at 104th Street (proposed alignment stationing 166+00 through 182+25). The centerline of UPRR's potential third track and the centerline of the proposed RLE would have a minimum separation of 27.6 feet. If the UPRR East Option is selected, the minimum separation distance would not be met through this segment of the extension. Relocating the existing pump station so the alignment could be adjusted is not feasible. A crash wall could be provided between the UPRR tracks and the proposed extension.

- Farther south from 104th Street, the proposed alignment again shifts west towards the UPRR tracks north of the proposed Michigan Avenue station (near 116th Street, from approximate station 257+00 to 278+00). The centerline of UPRR's potential third track and the centerline of the proposed RLE have a minimum separation of 46.8 feet. More detailed design could likely adjust the proposed alignment through this section to provide the minimum required separation. Note that the proposed alignment in this area is entirely outside the existing UPRR right-of-way.

The minimum clearance distance would be met along the entire West Option except where the CTA facility would cross the UPRR at I-57 and near the Metra Electric District tracks.

Verification #2: Design Speed at Wendell Smith Park

The proposed alignment from April 2013 had a 15 mph (335-foot radius) curve connecting the East-West portion of the extension (which runs along I-57) to the North-South portion of the extension (which would run along the east edge of the UPRR right-of-way.) The small radius was intended to minimize the impacts the proposed improvement would have on Wendell Smith Park. A curve speed of 15 mph would be a severe constraint on a new rail alignment and has been dropped from further consideration. We checked the possibility of increasing the design speed through this turn to improve future operations. (See the February 27, 2015 memorandum *Documentation of Red Line Extension Curve Speed Discussion* for curve speed criteria.) The attached Exhibit 1 depicts the various design speeds that were analyzed and their corresponding impacts to the park.

Generally, as the design speed increases the impacts on the park would become more severe. A 25 mph (388.80-foot radius) curve could provide a faster operation speed for the CTA with minimal additional impacts on the park compared to the proposed 15 mph curve. Increasing to a 35 mph (730.13-foot radius) curve for the East Option would cause severe impacts to the park, specifically eliminating the ability to use the existing baseball fields. Curves of 45 mph and 55 mph are not recommended with either alignment due to impacts at the park.

Verification #3: Location of Proposed 103rd St Station

The proposed 103rd Street station would be located one block north of the historic Roseland Pump Station, located at 351 West 104th Street. The Roseland Pump Station provides water to approximately 750,000 residents of the City of Chicago and south suburbs. The minimum separation between the edge of the proposed track structure and the face of the pump station building is 8.8 feet. We checked to see if adjusting the location of the proposed 103rd Street station could increase this spacing. Shifting the station to the north would have no impact on the spacing between the proposed CTA structure and the pump station. The minimum spacing occurs south of the point of tangency of the southernmost curve associated with the 103rd Street station, as shown in the attached Exhibit 2; therefore, shifting the station north has no effect on this minimum spacing. Shifting the station south would decrease this minimum spacing.

The station could be shifted approximately 265 feet north to avoid conflict with the existing communications tower located just west of the intersection of Harvard Avenue and 103rd Place. This shift would require two additional properties to be acquired where the northernmost station curves tie back into the alignment. The distance pedestrians would walk from both the surface lot (at the southwest corner of the UPRR and 103rd Street) and the bus turnaround lot (at the northeast corner to the station platform) would be increased by this shift. The shift of the 103rd Street station to the north to avoid the tower is not included on the plan sheets as additional residential displacements would be required.

Verification #4: Illinois Department of Transportation Comments

The Illinois Department of Transportation (IDOT) provided several comments via e-mail (attached Exhibit 3) after reviewing the proposed RLE horizontal alignment in the area of I-90/94, I-57, and 95th Street.

IDOT commented that the piers for the proposed RLE structure "should be placed such that the Department has the flexibility to widen our roadways either towards the roadway's median or outward with standard cross-section elements. As such any pier(s) placed in our medians should be placed in the middle of our medians, not immediately behind any existing or proposed barrier walls. Also, any piers proposed on the outside of our roadways should be placed at least 27feet from the existing outside edges of pavement to account for any additional lanes, shoulders, and barrier walls that are needed to protect the pier from being struck by a vehicle." Exhibit 1 depicts the conceptual pier locations for the proposed alignment from the existing 95th street station south to Wendell Smith Park. CWC adjusted the pier locations to fall outside the limits of IDOT's future widening.

IDOT pointed out that any structure crossing a roadway should provide a minimum of 15'-0" of vertical clearance. The RLE would cross the following IDOT facilities: 95th Street, southbound I-94, I-57 ramp, and I-57 mainline. The extension would not modify the existing 15'-10" clearance at 95th Street. The proposed extension would cross the existing southbound I-94 tunnel. This clearance would not be affected by the RLE. The profile would rise from the tunnel, cross the I-57 ramp, and eventually cross over Wentworth Avenue. A 16-foot clearance is provided over Wentworth Avenue, which would lead to an approximately 31-foot clearance over the I-57 ramp. The alignment would then cross the I-57 mainline with an approximately 39-foot clearance. Excessive clearance is provided over the IDOT roadways because of the height the profile reaches to go over Wentworth Avenue.

IDOT also commented on the need for barrier warrant analysis, permitting, and air rights agreements. These tasks will be addressed in the future when the project moves from conceptual to preliminary design.

EXHIBIT 2 - 103RD ST STATION ANALYSIS (1/1)

From: Salley, Jason R [mailto:Jason.Salley@illinois.gov]
Sent: Tuesday, December 16, 2014 8:39 AM
To: Tandon, Sonali; Baczek, John A
Subject: RE: CTA Red Line Extension

Sonali,
Good morning.

We have looked at your proposed alignment of the CTA's Red Line Extension near I-90/94 at I-57 & 95th St and we offer the following comments:

1. The piers for the structures carrying the Red-Line over any of the Department's roadways should be placed such that the Department has the flexibility to widen our roadways either towards the roadway's median or outward with standard cross-section elements. As such any pier(s) placed in our medians should be placed in the middle of our medians, not immediately behind any existing or proposed barrier walls. Also, any piers proposed on the outside of our roadways should be placed at least 27-ft from the existing outside edges of pavement to account for any additional lanes, shoulders and barrier walls that are needed to protect the pier from being struck by a vehicle.
2. Any structures carrying the Red-Line over our roadways should provide at least 15'-0" of vertical clearance over our roadways.
3. The existing barrier walls along I-57 may have to be extended and/or replaced in order to adequately protect any proposed piers along I-57 from being struck by vehicles. The length of the extensions will be subject to barrier warrant and length of need analyses to be done during Contract Plan preparation should this project proceed towards construction. New barrier walls or guardrail may also be required if piers are proposed along I-57 where there are no existing barrier walls to extend. Lastly, existing barrier that are to be extended to protect proposed CTA piers may need to be rehabilitated or replaced depending on their condition at the time of the construction of this project. The cost sharing of this work is to be determined at the time of the preparation of the Contract Plans.
4. Should the extension of the Red-Line move towards Contract Plan preparation, the CTA should ascertain a Permit from the Department for the construction of the extension within our Right-of-Way.
5. The extension of the Red-Line as depicted will require an Air Rights Agreement with the Federal Highway Administration as well as the Department.
6. Wentworth Ave is under the Jurisdiction and Maintenance of the City of Chicago. Please coordinate this extension with them in order to ascertain any requirements or concerns that they might have. Please share their comments with the Department so that all concerns are shared with all of the interested parties along the corridor.

Attached you will find a copy of the geometrics for I-57 south of its interchange with I-90/94 as per the Department's Phase I report for I-90/94 from 31st Street to I-57.

Please contact me or John Baczek if you have any questions or need any clarifications.

Sincerely,
Jason Salley, P.E.
Geometrics Engineer

EXHIBIT 3 - IDOT Comments (1/1)

CWC Transit Group

Memorandum

To: *CTA, Sonali Tandon*

From: *CWC - Wight & Company*

Date: *December 2, 2014, revised March 16, 2015*

Subject: *Evaluation of Grade Separation of Red Line Extension*

Purpose

The purpose of this memo is to compare the potential benefits or drawbacks of constructing the proposed Red Line Extension (RLE) as an elevated track structure with the benefits or drawbacks of constructing the RLE as an at-grade track with roadway overpasses or underpasses.

The proposed extension must be elevated from 95th Street until south of Interstate 57 (I-57) (approximately station 135+00) to provide the required clearance over the expressway. South of I-57, the proposed track structure could potentially be lowered to match existing grade. Using the maximum allowable grade, this match point would occur 950 feet south of the interstate (approximately station 144+50.) The profile of this option is shown in the attached Exhibit A. The proposed track can potentially remain at grade for 2.57 miles (approximately station 280+00), at which point the track must be elevated to clear the CN/Metra Electric District mainline tracks.

Costs presented in this memorandum are macro-level estimates based on 2012 dollars. The costs presented are for comparison of the construction costs and do not include soft costs and unallocated contingencies. These costs do not represent the full cost of implementing the RLE.

Option #1: Aerial Track Structure

The initial planning phases, including the Alternatives Analysis study that was completed in 2009, has the RLE on aerial track structure.

Approximate construction cost = $100 to $120 million per mile of double track

Estimated Total Construction Cost ~ $120 M * 2.57 miles = $308.4 Million

Benefits:

- Minimizes effects on the neighborhood
- Minimizes noise levels as compared to at-grade trains
- Built-in security by being above grade
- Maintains existing roadway access

Drawbacks:

- Cost of aerial structure
- Public perception of visual impacts due to height of the structure

Option #2: At-grade track, roads overpass track

Approximate construction cost = $10 million per mile of double track.

Track construction cost ~ $10 M * 2.57 miles = $25.7 Million

Roadway overpasses would be constructed at 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Wentworth Avenue, 115th Street, and State Street (8 Crossings).

Overpass construction cost ~ $25 million / each * 8 = $200 Million

Estimated Total Construction Cost ~ $25.7 Million + $200 Million = $225.7 Million

Benefits:

- Potential $82.7M construction savings versus Option #1: Aerial Track Option (Note: Potential construction savings would not outweigh the additional right-of-way acquisition covered under “Drawbacks” below.)
- CTA at-grade, vehicular traffic is grade separated from the CTA and Union Pacific Railroad (UPRR)

Drawbacks:

- An analysis of the potential 107th Street overpass revealed approximately 220 residents would be adversely affected by the construction of the overpass (reduced access, increased travel distance and time, perceived visual impacts of overpasses, additional displacements, neighborhood interruption during construction, etc.) Extrapolating to the entire project, approximately 1,500 homes would have some adverse impact. Refer to Exhibit B.
- Additional right-of-way acquisition. Refer to Exhibit B.

- Closure of some cross streets where they intersect with the embankment for bridge approaches.
- Relocation of utilities along the roadways and cross streets.
- Community impacts due to neighborhood isolation.
- Potential visual impacts for homes near overpasses (abutting an approximately 30-foot tall embankment).
- Additional security may be required to protect the train operations and third rail as compared to aerial track structure.
- Potential increase in noise levels affecting adjoining residents.

Option #3: At-grade track, cross-roads underpass track

Approximate construction cost = $10 million per mile of double track.

Track construction cost ~ $10 M * 2.57 miles = $25.7 Million

Roadway underpasses would be constructed at 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Wentworth Avenue, 115th Street, and State Street (8 Crossings).

Underpass construction cost ~ $60 million / each * 8 = $480 Million

Estimated Total Construction Cost ~ $25.7 Million + $480 Million = $505.7 Million

Benefits:

- CTA at-grade, vehicular traffic is grade separated from the CTA and UPRR

Drawbacks:

- Costs of structure is significantly higher than Options #1 and #2.
- Property impacts similar to Option #2; additional property impacts would occur to accommodate the underpass structure (reduced access due to grade difference and needed retaining wall for underpass structure).
- Additional right-of-way acquisition.
- Closure of some cross streets required where the streets intersect or would require lowing cross streets to intersect at grade. Lowering of cross streets would require additional right-of-way and additional property impacts due to access.
- Community impacts due to neighborhood isolation.

- Additional costs associated with a pumping station for drainage (flood prevention).
- Relocation of utilities along the major roadways and cross streets.
- Additional security may be required to protect the train operations and third rail as compared to aerial track structure.
- No additional benefits over the Options #1 or #2

Option #4: At-grade track between crossroads, maximum allowable grade

Another option considered to take advantage of the significantly lower cost of constructing at-grade track is to lower the profile of the proposed extension between crossroads to run at-grade as much as possible while avoiding the prohibitive adverse effects of constructing roadway overpasses or underpasses. Using the maximum allowable grades provided in the *CTA Infrastructure Design Criteria Manual*, and the minimum vertical curves recommended by AREMA, Exhibit C was created to show what the proposed profile would look like if the track were lowered to grade between crossroads. Note that Exhibit C does not show a realistic construction alternative; its purpose is solely to show the maximum possible length of at-grade construction between crossroads.

The combination of the tight existing crossroad spacing and the relatively shallow maximum allowable profile grade prevents the profile from dropping down to grade in all but two locations: 950 feet between 103rd Street/ 107th Street, and 1000 feet between 111th Street/ Wentworth Avenue.

Benefits:

- Potential construction savings versus Option #1: Aerial Track Option =

1950 ft/5280 ft * ($120 Million - $10 Million) = $ 40.6 Million

Drawbacks:

- Potential customer discomfort caused by constantly varying profile (a “rollercoaster” feel).
- Increased train spacing to provide safe braking distance which would lead to increased running time and need for additional cars.
- Increased operational risks related to traction.
- Additional energy consumption, vehicle wear and tear, and wheel/track maintenance.

Option #5: Track on retained embankment

After analyzing the option of varying the vertical alignment at the maximum allowable grade, we considered varying the vertical alignment at a gentler grade which would avoid the "rollercoaster" feel of the maximum grade while taking advantage of shorter structure heights. In conjunction with the gentler grade, we evaluated where it would be feasible to install the tracks on embankment with retaining walls rather than aerial track structure.

A significant portion of the alignment could potentially be built on embankment with retaining walls. Below are the approximate station ranges of the UPRR East Option which could be built on retained embankment:

Start Station	End Station	Retaining Wall Length
137+50	150+00	1,250 ft
150+75	159+85	910 ft
165+80	189+60	2,380 ft
190+30	203+08	1,278 ft
203+83	209+85	602 ft
217+13	241+34	2,421 ft
242+04	252+14	1,010 ft
252+84	257+55	471 ft
258+25	264+27	602 ft
270+40	280+00	960 ft
	Total	11,884 ft

Benefits:

- Track structure on retained embankment can be constructed for approximately $50 Million / mile. Potential construction savings for this option versus Option #1: Aerial Track Option = 11884 ft/5280 ft * ($120 Million - $50 Million) = $ 157.5 Million (Note that the "planning level" costs per mile are intended to show the order of magnitude of cost savings in order to determine whether an alternative has merit for further study in the Preliminary Engineering phase. If additional crossings are required, the order of magnitude cost savings would be similar.)

- Potential for reduced noise impacts based on use of ballasted track system on the embankment.

- Potential lower maintenance for retaining walls versus aerial track structure.

Drawbacks:

- Visual impacts (and accompanying community impacts) from retaining walls (approximate 23′ retained height above grade).
- Visual impacts from potential graffiti (and accompanying increased maintenance cost).

Conclusions:

- Constructing the proposed extension at-grade, with roadway underpasses is the most expensive option, and offers no unique benefits.
- Constructing the proposed extension at-grade, with roadway overpasses offers potential construction savings on the track, but could potentially adversely affect more homes than Option #1: Aerial Track Structure. Although a detailed analysis of the additional right-of-way acquisition was not performed, the potential adverse impacts on such a large number of homes likely outweigh the potential $100 million in savings.
- The small cost benefits of Option #4 (which shows only a short section of track has the potential to be constructed at-grade) would not outweigh the operational drawbacks of the inclines.
- Options #1 and #5: Aerial Track Structure and Track on Retained Embankment would extend transit service with the best balance of cost and neighborhood impacts over Options #2, #3, and#4. Option #5 has the potential for a sizable construction cost savings (over $100 million) if the potential community impacts (including visual impacts) are acceptable or can be mitigated.

Memorandum

To: *Sonali Tandon*

From: *CWC, Wight & Company*

Date: *December 2, 2014, revised June 11, 2015*

Subject: *120th Street Rail Shop and Yard Program*

The purpose of this document is to summarize program data collected for a Red Line Extension (RLE) yard for use in a future design phase of the project. This document was developed through meetings with CTA Rail Operations, Infrastructure, Planning, Maintenance, and Scheduling. The programming elements listed in this document indicate an ideal yard and are based on past experiences and lessons learned. The design and layout of the Midway yard was used as a guide when developing this document as Midway represents a yard on the current CTA system with good flow and operations. At the time of design, current CTA design criteria pertinent to yards (as found in the Infrastructure Design Criteria Manual) should be reflected in the layout and design.

Note that the conceptual layout related to this document was required to function with an intermediate RLE phase having service terminating at 115th Street and the ultimate RLE extension to 130th Street. In the intermediate phase, yard storage should accommodate a minimum of 288 cars on storage tracks. (Potential storage on the interior cleaning track, shop leads, or yard leads would not be included in this count.) In the ultimate build-out, yard storage should accommodate a minimum of 340 cars. See the yard capacity attachment to this memorandum for further detail.

The existing 98th Street Yard could be used to store extra trains or for sweeping cars. The use of the existing 98th Street Yard should be considered when designing the future yard. The 98th Street Yard should not be used as a maintenance facility after the new yard becomes active.

GENERAL

This scope document was developed to indicate the overall scope of the Red Line Extension - 120th Street Rail Shop and Yard and indicate the general design parameters. The scope does not indicate or describe all the work required for the full performance and completion of the project. The materials, details, sizes and quantities of the rail shop and yard are to be designed by a future designer and constructed by a contactor. The designer and contractor shall provide all the requirements of the scope documents and shall include all items and services reasonably inferable from the scope documents. The designer and contractor shall only have contact with the firm retained to prepare these scope documents as authorized by the CTA. The preparer of the scope documents will not be responsible for the acts or omissions of the designer, contractor or any subcontractor or sub-consultant.

PROJECT LOCATION & EXISTING CONDITIONS:

The site of the proposed Red Line Extension Rail Yard is generally industrial in nature. It is located west of the I-94 expressway and Lake Calumet at approximately 122nd Street. The site is accessible by Cottage Grove Avenue as well as local access drives. The Metropolitan Water Reclamation District currently owns the site as well as much of the adjacent properties to the south and east. Three existing train tracks directly to the east of the site are operated by the Northern Indiana Commuter Transportation District, Chicago South Shore and South Bend Railroads. The K-Five Materials Corporation plant is directly northwest of the proposed site.

CODE COMPLIANCE

The entire project shall comply with the City of Chicago, State of Illinois and Federal Code requirements and the American with Disabilities Act (ADA) as applicable.

The entire project shall also comply with the Chicago Transit Authority standards, unless otherwise shown.

ARCHITECTURAL SCOPE

Site

Yard:

- 11 Storage tracks – various combinations of train lengths for a total of 340 cars not including any shop tracks, shop leads, or yard leads

- Track 12 (adjacent to shop) shall have door level cleaning platform with area allocated for trash containers.

- Sidewalks between every storage track, or utility vehicle access width between every other storage track – see yard section alternatives attachment to this memorandum.

- The storage track shall accommodate two 16-foot drives crossing the storage tracks generally running southwest to northeast from each end of the shop building – see plan view.

- The yard should generally be level and should be raised above the potential flood elevation. The profile should include slight upward slopes at each end to prevent wind-driven roll-away trains.

- The use of photovoltaic panels should be studied to cover and protect the parked trains or a portion of the parked trains from the elements and to offset the building electrical load.
- A yard master tower is required. Master tower is depicted in the exhibit documents on the roof of the shop.
- The site lighting should be carefully planned to be energy efficient, vandal resistant, easy to maintain, and meet safety regulations. American Railway Engineering Maintenance of Way Association (AREMA) policy should be used as a minimum standard and guideline for the lighting of the yard. Fixtures utilizing the latest available technologies should be considered.
- A secure fence shall be provided around the entire yard and coordinated with the security system. (Perimeter cameras with infrared and analytics should be considered.)

Other Site Requirements (including exterior of shop):

- Minimum of 130 vehicle parking spaces including handicap accessible spots as required by code.
- All site utilities shall be coordinated for clearances and cover depths to meet each specific utilities requirement.
- Site drainage shall conform to the City of Chicago Stormwater Management Ordinance Manual and City of Chicago Regulations for Sewer Construction and Stormwater Management. Best Management Practices shall be utilized wherever possible.
- Loading dock is required for parts delivery. Truck turning radius required to be coordinated with CTA.
- Landscape shall be in accordance with the City of Chicago zoning code.
- Provide locations for snow and track/bulk material storage.
- Trash compactor located near loading dock.
- Trash bin near cleaning platform.
- Provide sections of short track for non-revenue equipment storage.

Building

The floor area of the entire shop including the track bays, administration, maintenance and ancillary areas is depicted in the exhibit document as 85,000 SF. The final area should be coordinated with CTA to confirm all building requirements are met. The envelope design must properly address performance concerns including thermal, condensation, durability, constructability and economy. Daylighting and high performance glazing shall be utilized in the shop and administration areas. The floor area depicted in the exhibit drawings show all the programed space located on the main level but multiple levels may be utilized if it is found to be economical. Stairs and an elevator would need to be added to the program if multiple floors are utilized. Depending on the type of hoists used, a partial basement may be required.

Shop:

- Five required track bays - All five tracks run all the way through shop
- Interior Wash Track:
    - No Pit
    - Minimum capacity of 10 cars
    - Pull Through access with overhead doors at both ends
    - Out-to-out width for the bay to accommodate the brushes and control room
    - Water treatment and water recycling equipment
- Pit Track:
    - Minimum capacity of 10 cars
    - Overhead door access on both ends
- Wheel Truing Track:
    - Truing machine (4-car length) with hoists on the remainder of the track
- Two (2) Shop Tracks with Hoists
    - Minimum capacity of 10 cars each
    - Overhead door access on both ends

General/Administration:

- Shop Office (must be located on 1st floor)
- Superintendent Office
- Conference/Classroom
- Lunch Room
- Pantry/Kitchen

- Janitor Closets (2)
- Building Maintenance
- Grounds Maintenance
- Track Maintenance
- Cab Signal Maintenance
- Yard Master Tower

Toilet/Lockers:

- Main Men's Locker Room
- Main Women's Locker Room
- Maintenance Men's Locker Room
- Maintenance Women's Locker
- Office Unisex Toilet

Mechanical/Electrical:

- Mechanical Equipment Room
- Electrical Equipment Room
- Communications/IT Room

Storage Areas:

- General Building Storage
- Small Part Storage
- Hazardous Material Storage
- Oil Storage

STRUCTURAL

The foundation and slab system shall be designed by a structural engineer based on recommendations from the geotechnical engineering report. The structural framing system shall be designed in accordance with generally accepted engineering principles. The structural system shall be selected so that the chemicals and materials used in the shop and wash track shall not have a negative impact on the structural systems performance.

MEP

Mechanical

The HVAC system shall be selected to be energy efficient, meet all indoor air quality and thermal comfort requirements and must be straightforward to operate and maintain. Incorporation of renewable energy sources into the design of the building is recommended where possible. An appropriate system includes wind turbines and photovoltaic panels capable of generating electric energy to offset the building's electrical load.

Electrical

Incoming electrical service should be discussed with the CTA and selected to meet the facility needs. The size of the electrical service equipment shall be determined by a Professional Engineer to conform to the City of Chicago Building Code and the National Electrical Code. Interior Lighting shall be provided to meet the requirements of the occupants and utilize a minimum number of separate lamps for building maintenance.

Plumbing/Fire Protection

The building shall provide restrooms facilities capable of meeting CTA requirements and plumbing and accessibility codes. Low water consumption fixtures should be selected. Selection of toilet accessories, partitions and lockers should be durable and easy to maintain. The design shall include fire protection according to applicable codes including heat and smoke detectors, and associated alarm sirens and strobes. The fire alarm system shall be integrated with the City of Chicago security annunciation system to alert proper authorities. An automatic sprinkler system shall also be included. The fire alarm system will be of addressable type, and be in accordance with the City of Chicago Building Code, National Fire Protection Association and the requirements of the Bureau of Fire Prevention, whichever is more stringent.

Communications

The provisions for information technology shall be coordinate with the CTA IT department. The data system shall be a combination of direct cable and wireless.

Automation, Measurement & Verifications

The building shall include a Building Automation System (BAS). The systems that tie into the BAS system shall be discussed with the CTA. The controls system shall integrate to a Graphical User Interface (GUI). A measurement and verification system to monitor energy use should be considered and shall be discussed with CTA.

SECURITY

The security system shall consist of intrusion detection/access control and Surveillance System. The security system will be monitored, if required, by a third party security contract, or with a direct link to the Chicago Police Department local precinct. A direct link to the CTA Control Center will also be included. The surveillance system shall be provided with Raceways, Closed-

Circuit Television (CCTV)-UTP cables, jacks, patch panels, patch cords, high resolution Pan Tilt Zoom (PTZ) cameras, infrared cameras, multiplexes, monitors, Digital Video Recorder (DVR), interface modules, fiber distribution and all appurtenances for a complete surveillance system. The surveillance system coverage shall include but not be limited to, the building interior, the rail yard, loading areas and parking areas. Exterior cameras shall have the capability to send the video signal to the OEMC (Office of Emergency Management and Communications) upon request as a part of the Third Party Initiative Program. Camera selection shall be coordinated with OEMC for their compatibility.

RLE Yard Storage Requirements

Ultimate Build-Out

Assumptions:

- Store 80 cars (8 x 10-car trains) for RPM ultimate build-out
- Replace maximum storage in 98th Yard
- Store 78 additional cars for RLE operation
- The minimum number of Red Line cars in operation (due to 7/24 service) is 40 cars (10 trains x 4 cars)
- Do not assume any trains stored on yard leads
- Discount storage requirements by 12 cars (~3%) for cars in shop undergoing maintenance, wheel truing, washing or interior cleaning

At night when 4-car trains are operating, ten 10-car trains are broken into ten 4-car trains (in service) plus ten 6-car trains which need to be stored

RPM	80	cars
98th Yard	234	cars
RLE	78	cars
Total	392	cars
In Service	(40)	cars
In Shop	(12)	cars
Storage	**340**	**cars**

5 Storage Tracks @ 32 cars (2 trains x 10 cars/train + 2 trains x 6 cars/train) +
6 Storage Tracks @ 30 cars (3 trains x 10 cars/train) = 340 cars

RPM Phase 1 and RLE to 115th Street

Assumptions:

- Store 40 cars (5 x 8-car trains) for RPM Phase 1
- Replace maximum storage in 98th Yard
- Store 64 additional cars for RLE operation to 115th Street
- The minimum number of Red Line cars in operation (due to 7 day/24 hour service) is 40 cars (10 trains x 4 cars)
- Do not assume any trains stored on yard leads
- Discount storage requirements by 10 cars (~3%) for cars in shop undergoing maintenance, wheel truing, washing or interior cleaning

At night when 4-car trains are operating, five 8-car trains are broken into ten 4-car trains - no need to store partial trains

RPM	40	cars
98th Yard	234	cars

Memorandum

To: *Sonali Tandon*

From: *CWC, Wight & Company*

Date: *February 19, 2015, revised March 16, 2015*

Subject: *130th Street Terminal Station Options*

The purpose of this memorandum is to provide a decision support document for the elimination of one of the station options for the extension of the Red Line to 130th Street. To date, the Union Pacific Railroad (UPRR) Rail Alternative has included two options for the 130th Street terminal station: the South and West Station Options. FTA has indicated that CTA should prepare the Draft Environmental Impact Statement (EIS) for the Red Line Extension (RLE) with the preferred alternative clearly identified to streamline the environmental process. To streamline the Draft EIS, CTA would like to present one terminal station in the Draft EIS; this memorandum serves as documentation.

This memorandum briefly describes the station options and evaluates the pros and cons of each option. This memorandum also provides a recommendation for the preferred station location.

130th South Station Option (Figure 1)

The South Station Option would be located immediately west of the Northern Indiana Commuter Transportation District/Chicago South Short & South Bend Railroad (NICTD/CSS&SBRR) right-of-way at 130th Street. The station and platform would be at grade. The station area would have three tracks running to the station. The platform would extend underneath 130th Street and would terminate before 130th Place, south of 130th Street. A total of 2,300 parking spaces are proposed in a seven-story parking structure. Pedestrians would access the station from 130th Place or from the parking structure. Vehicles would access the parking structure from 130th Street. Pedestrians from Altgeld Gardens would access the station from 130th Place, not needing to cross 130th Street.

130th West Station Option (Figure 2)

The West Station Option would be located along the north side of 130th Street at Evans Avenue. The station and platform would be at grade. A total of 2,300 parking spaces are proposed in a four-story parking structure plus a surface parking lot. Pedestrians from Altgeld Gardens would access the station through a pedestrian cross walk on 130th Street. A traffic signal at 130th Street, marked crosswalk, and curb ramps would be provided as part of the project.

Evaluation of Station Options

The City of Chicago Department of Transportation conducted a Market/Access study for the 130th Street Station in 2010 which evaluated the two station options. The study built upon CTA's Alternatives Analysis from 2009 but did not provide a recommendation for the final location of the station. The results of the study indicated that the South Station Option provided the best opportunity to meet the goals of the 130th Street Gateway Vision. The 130th Street Gateway Vision is to develop 130th Street into a gateway for the City of Chicago as well as the greater Calumet Area. The study stated that the South Station Option would:

- Promote possible development of a joint intermodal station with NICTD
- Support future studies to extend the Red Line across the Little Calumet River
- Encourage the visioning conducted by the Chicago Housing Authority for Altgeld Gardens
- Establish pedestrian and bicycle accessibility between 130th Street Station and the City's proposed Kensington Bikeway, Carver Military Academy and Altgeld Gardens
- Provide a potential catalyst for other public and private investment in the study area and as identified in the City's plans for the Calumet Region.

Stakeholders from the project area have indicated a preference for the South Station Option, as indicated in *Summary Report of the Developing Communities Project Community Visioning Session for the Proposed Red Line Extension*, compiled in September 2010. The master planning process undertaken by the Chicago Housing Authority (CHA) for the Altgeld Gardens Murray Homes in 2013 included evaluating the existing conditions, land uses in the planning area, and community facilities. The comprehensive master planning process recommended the South Station Option because it provided better connectivity to the Community Center and Ellis Avenue, which is a major north-south street that includes proposed retail. Stakeholders also indicated their preference for the South Station Option during the CTA public informational meeting held May 13, 2014.

The South Station Option is on tangent track leading to/from the proposed yard, which would be north of the station. To access the West Station Option, the tracks would curve to the west. In addition to the curved tracks, the cost of approximately 1100 feet of additional track needed for the West Station Option increases the cost over the South Station Option by nearly $30 million, assuming all other amenities to the station would be of equal value. The additional track and curve leading to the West Station Option would create higher operational costs over the South Station Option.

Based on the results of the environmental analysis performed for the RLE Draft EIS in 2012–2015, the West Station Option would have an impact on pedestrian safety; however, the proposed traffic signal at 130th Street and the pedestrian crosswalk would mitigate the impact. Both station options have the potential for wetland impacts. Fieldwork would be required at either location to determine if jurisdictional wetlands are present. Both station options would have traffic impacts related to the park & ride facilities off of 130th Street. Mitigation measures to minimize the traffic impacts include optimizing the traffic cycles and adding in turn-lanes. Both station options would also require land acquisition from the Metropolitan Water Reclamation District of Greater Chicago (MWRD).

The South Station Option would better serve the Carver Military Academy High School, located east of the station area, south of 130th Street. Students and faculty of the Carver Military Academy would be able to access the station through Doty Avenue. The South Station Option would be closer to the Ford Motor Company on Torrence Avenue.

The South Station Option would provide the best opportunity for a future connection to NICTD, because the NICTD tracks would parallel the proposed RLE at this station. Improving regional rail connections and linkages to other public transportation modes in the project area is one element of the RLE Project's purpose and need. The West Station Option would not accommodate a direct regional rail connection to other public transportation.

During a meeting with MWRD on September 16, 2013 regarding the proposed RLE yard and station options, MWRD indicated that they do not have future plans for any of the parcels where the station options are proposed. MWRD indicated that the vacant parcels are intended to act as buffers (both visually and for odors) for the lagoons to the surrounding communities. MWRD tentatively indicated that the South Station Option would be better than the West Station Option.

Recommendations

Based on the evaluation of station options, input from the local community, and project costs, the South Station Option is the preferred station location for the 130th Street Terminal Station. The South Station Option would provide benefits to the project and would best meet the project's purpose and need of providing other transit connections to NICTD in the future.

Section 1
Introduction

The Chicago Transit Authority (CTA) is proposing to extend the heavy rail Red Line from the 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed Red Line Extension (RLE) Project would include four stops. Each stop would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway (I-57) and I-94 Bishop Ford Freeway (I-94) cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. Figure 1-1 shows the project area.

The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Description of Construction summarizes analysis for the following alternatives (shown in Figure 1-2) that emerged from the Alternatives Analysis and National Environmental Policy Act (NEPA) scoping process. This list includes alternatives considered but not pursued.

- No Build Alternative
- Bus Rapid Transit (BRT) Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 1-2: RLE Project Alternatives

Section 2
Description of Build Alternatives

The following three alternatives are discussed in this technical memorandum: BRT Alternative, UPRR Rail Alternative, and Halsted Rail Alternative. One of the alternatives, the UPRR Rail Alternative, has three options. For a more detailed description of the alternatives, including the proposed transit operations, refer to the *Description of Alternatives*. Two alternatives and one option are no longer being pursued (for reasons stated in the Draft Environmental Impact Statement: BRT Alternative (Section 2.1), UPRR Rail Alternative – ROW Option (Section 2.2.1.1), and Halsted Rail Alternative (Section 2.3 including the 119th Street Yard and Shop). The UPRR Rail Alternative West Station Option is also no longer being pursued.

2.1 BRT Alternative

The proposed BRT Alternative is a 5.5-mile long BRT alternative that would operate between the existing 95th Street Terminal and 130th Street via 95th Street, Michigan Avenue, 127th Street, Indiana Avenue, and 130th Street. Four stops with improved bus shelters would be built at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. The bus route would continue through Altgeld Gardens with stops at 131st Street and Langley Avenue, 131st Street and Corliss Avenue, 131st Street and Ingleside Avenue, 132nd Street and Ellis Avenue, 133rd Street and Ellis Avenue, and 133rd Place and Corliss Avenue. The BRT Alternative is illustrated in Figure 2-1.

The streets on which the BRT Alternative would operate are summarized in Table 2-1.

Table 2-1: BRT Alternative Street Summary

Street	Width (feet)	Number of Lanes	Center Turn Lane	Parking
95th Street	80	4	Yes	No
Michigan Avenue	40	2	No	Yes
127th Street	40	4	No	No
Indiana Avenue	40	4	No	No
130th Street	60	4	Yes	No

2.1.1 Infrastructure

Projects already committed through the Chicago Metropolitan Agency for Planning Fiscal Year 2010–2015 Transportation Improvement Program would be constructed. Regular maintenance of existing track and structures would continue.

No new dedicated bus lanes would be provided for the BRT Alternative. Parking lanes would be removed along some portions of the alignment.

2.1.2 Stops

Improved bus shelters would be provided at the 103rd Street, 111th Street, Kensington Avenue, and 130th Street stops. Park & ride facilities with a total capacity of 700 parking spaces in the year of construction and up to 2,800 parking spaces in a later year (2030) would be constructed at the stop locations, as shown in Table 2-2.

Table 2-2: BRT Alternative Park & Ride Facilities

Location	Construction Year	Horizon Year (2030)
103rd Street	100	200
111th Street	100	200
Kensington Avenue	100	1,000
130th Street	400	1,400
Total	**700**	**2,800**

2.1.3 Yard

The 98th Street yard and shop at the south end of the existing Red Line would continue to be used for Red Line trains. Currently all Red Line cars are operated and maintained from the Howard and 98th Street facilities. The 98th Street shop facility is more than 40 years old, having been constructed in 1969 as part of the original Dan Ryan Line construction project. The 98th Street shop is within an expressway median and is difficult to access for material delivery because of its grade separation from local streets. The 98th Street yard and shop would eventually need to be replaced regardless of the RLE Project. There is capacity at existing CTA bus garages to store buses for the BRT Alternative, and the 103rd Street Garage would be primarily used.

2.2 UPRR Rail Alternative

The UPRR Rail Alternative would extend the heavy rail transit Red Line from the existing 95th Street Terminal to a terminal location at 130th Street. The Chicago Transit Board adopted the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 meeting.

The UPRR Rail Alternative is a 5.3-mile extension of the existing Red Line. The Red Line would operate on an elevated structure heading south from 95th Street along I-57 for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. It would then turn south along the UPRR corridor to approximately 111th Street where it would head southeast. East of Prairie Avenue, the alignment crosses over the Canadian National (CN)/Metra Electric tracks near 119th Street, where it would transition to an at-grade profile and then continue southeast alongside the Northern Indiana Commuter Transportation District Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) ROW using a portion of Norfolk Southern Railway and Consolidated Rail Corporation right-of-ways to terminate at 130th Street. Four stations are planned at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The UPRR Rail Alternative is illustrated in Figure 2-2.

Figure 2-2: UPRR Rail Alternative with ROW, East, and West Options

Three UPRR Rail Alternative options for the length between I-57 and the CN/Metra Electric tracks will be studied in the EIS:

- ROW Option: CTA tracks placed in the UPRR ROW; UPRR trains would relocate to another corridor as part of a separate, independent project under study by the City of Chicago
- East Option: CTA tracks placed immediately adjacent to the UPRR ROW to the east
- West Option: CTA tracks placed immediately adjacent to the UPRR ROW to the west

Two options for the 130th Street station would be studied in the EIS:

- South Station Option: located to the west of the NICTD/CSS & SBRR ROW at 130th Street
- West Station Option: located along the north side of 130th Street to the west of the NICTD/CSS & SBRR route

2.2.1 Infrastructure

All three UPRR Rail Alternative options would include operations on elevated structure from 95th Street to the CN/Metra Electric tracks near 119th Street. The alignment would then continue at grade through an industrial area with no public through streets. Existing service driveways and Metropolitan Water Reclamation District of Greater Chicago (MWRD) access roads would be grade separated.

The elevated substructure would consist of reinforced cast-in-place concrete hammerhead piers on drilled shafts or steel piles. The superstructure would consist of steel girders with a concrete deck supporting direct fixation track. A typical cross section is shown on Figure 2-3.

SECTION
*REQUIRED IF CTA STRUCTURE IS LESS THAN 50' FROM ℄ NEAREST UPRR TRACK
LEGEND
REQUIRED UPRR CLEARANCE

Figure 2-3: UPRR Rail Alternative Side Option Typical Cross Section

The minimum vertical clearances are 14 feet 9 inches for local roadways and 16 feet 9 inches for freeways. At locations where the alignment would cross UPRR tracks, the minimum vertical clearance would be 23 feet 4 inches in accordance with UPRR standards. The minimum vertical clearance for all other railroads is 23 feet 0 inches. IDOT has requested a minimum of 27'-0" from existing edge of pavement along I-57 to the face of any pier to preserve room for future widening.

Spans between piers are expected to typically be 60 to 100 feet, and as long as 140 feet. Span length is based on site conditions, geometrics, and clearance requirements.

2.2.1.1 ROW Option

As part of the UPRR Rail Alternative ROW Option, the CTA tracks would be placed in the UPRR ROW between I-57 and the CN/Metra Electric tracks. The UPRR tracks may be relocated to another corridor as part of a separate, independent project under study by the City of Chicago.

Substations are tentatively proposed at the following locations: to the west of the CTA tracks between 104th and 105th Street; to the west of the CTA tracks between Perry Avenue and Lafayette Avenue; and to the west of the CTA tracks north of the proposed parking structure for the South Station Option, or along the curve of the CTA tracks near 130th Street for the West Station Option. An additional substation is proposed within the 120th Street yard and shop facility.

2.2.1.2 East Option

As part of the East Option, the CTA tracks would be placed immediately adjacent to the UPRR ROW to the east between I-57 and the CN/Metra Electric tracks. UPRR anticipates adding a third track to the east of their existing two tracks. The distance between the centerline of the proposed UPRR third track and the CTA structure would be 50 feet except for the following locations: 103rd Street station (approximate stationing 154+00 to 181+00 and between State Street and Michigan Avenue (approximate stationing 255+00 to 270+00).

Substations are proposed at the following locations: 98th Street Yard and Shop, near 101st Street, near 107th Street, near Lafayette Avenue, within the 120th Street yard and shop area, and near the 130th Street station.

2.2.1.3 West Option

As part of the West Option, the CTA tracks would be placed immediately adjacent to the UPRR ROW to the west between I-57 on the north end and the UPPR tracks near Kensington Park on the south end. The distance between the UPRR centerline of existing west track and the proposed CTA structure would be 50 feet except for the following locations: 99th Street (approximate stationing 138+00 to 142+00) and at the Prairie Avenue/UPRR crossing (approximate stationing 275+00 to 285+00).

Substations are proposed at the following locations: 98th Street Yard and Shop, near 101st Street, near 107th Street, near Lafayette Avenue, within the 120th Street yard and shop area, and near the 130th Street station.

2.2.2 Stations

Four stations are proposed for the UPRR Rail Alternative options: 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Two station options are under evaluation for the 130th Street station: a South Station Option and a West Station Option.

All intermediate stations are proposed as island platforms, 26 feet wide and 520 feet long. Platforms would be built to accommodate ten-car trains. All stations would be Americans with Disabilities Act (ADA) accessible with elevators.

Bus transfer and park & ride facilities are planned for all stations with a capacity of 1,500 parking spaces in the year of construction and up to 3,700 parking spaces in a later year (2030), as shown in Table 2-3.

Table 2-3: UPRR Rail Alternative Park & Ride Facilities

Location	Construction Year	Horizon Year (2030)
103rd Street	200	200
111th Street	200	200
Michigan Avenue	200	1,000
130th Street	900	2,300
Total	**1,500**	**3,700**

A brief description of the stations and parking is provided below. For more details, please refer to the *Description of Alternatives*.

2.2.2.1 103rd Street Station

The primary entrance to the 103rd Street station would be located on the north side of 103rd Street, and the auxiliary entrance would be located on the north side of 103rd Place. The station would be ADA accessible with elevators.

As part of the ROW Option, two surface parking lots would be located to the northeast and southwest of the intersection of 103rd Street with the UPRR tracks. A bus turnaround for CTA bus route #9 would be included at the northeast parking lot.

As part of the East Option, a surface parking lot would be located to the east of the tracks north of 103rd Street and a second surface parking lot would be located to the west of the tracks between 103rd Street and 103rd Place. A bus turnaround for CTA bus route #9 would be included at the northeast parking lot.

As part of the West Option, a surface parking lot would be located to the west of the tracks between 103rd Place and 104th Street. A bus turnaround for CTA bus route #9 would be included at the northeast corner of the 103rd Street and UPRR tracks intersection.

2.2.2.2 111th Street Station

For the ROW and West Options, the primary entrance to the 111th Street station would be located near 110th Place. The auxiliary entrance would be located north of 110th Street. For the East Option, the primary entrance to the 111th Street station would be located at 110th Street. The auxiliary entrance would be located between 109th Street and 109th Place. The station would be ADA accessible with elevators.

As part of the ROW Option, two surface parking lots would be located to the northeast and northwest of the intersection of 111th Street with the UPRR tracks. A bus turnaround for Pace bus route #352 would be included at the northwestern parking lot.

As part of the East Option, a surface parking lot would be located to the east of the tracks north of 110th Place, and a second surface parking lot would be located to the west of the tracks between 111th Street and 110th Street. A bus turnaround for Pace bus route #352 would be included at the northwestern parking lot.

As part of the West Option, a surface parking lot would be located to the west of the tracks between 110th Place and 110th Street. A bus turnaround for Pace bus route #352 would be included at the parking lot.

2.2.2.3 Michigan Avenue Station

For the ROW and West Options, the primary entrance to the Michigan Avenue station would be located on the west side of Michigan Avenue, and the auxiliary entrance would be located on the south side of 116th Street. For the East Option, the primary entrance to the Michigan Avenue station would be located on the east side of Michigan Avenue. The auxiliary entrance would be located on the north side of 116th Street. The station would be ADA accessible with elevators.

As part of the ROW Option, a three-story parking garage would be constructed. The ground level of the parking garage would be available for retail and/or community facilities and would include a bus turnaround facility for CTA route #119 and Pace route #359. A second surface lot would be located to the east of the tracks, between 116th Street and Kensington Avenue.

As part of the East Option, a three-story parking garage would be constructed. The ground level of the parking garage would be available for retail and/or community facilities, and would include a bus turnaround facility for CTA route #119 and Pace route #359. A second surface lot would be located to the east of the tracks, between 116th Street and Kensington Avenue.

As part of the West Option, a five-story parking garage would be constructed. The ground level of the parking garage would be available for retail and/or community facilities, and would include a bus turnaround facility for CTA route #119 and Pace route #359.

2.2.2.4 130th Street Station

Two options for the 130th Street station are being studied in the EIS:

- South Station Option: located along the west side of the NICTD/CSS & SBRR ROW, just north of 130th Street
- West Station Option: located to the west of the NICTD/CSS & SBRR ROW and along the north side of 130th Street

As part of both station options, the station building would be approximately 15,000 square feet (200 feet by 75 feet), which would follow CTA's typical design standards for stations. The station house would provide sufficient space for CTA customer operations, maintenance, mechanical rooms, staff offices, and areas for small retail stores. The retail area would primarily serve commuters and local residents.

Both the South and West Station Options would be configured with three tracks, creating a 600-foot-long side and center platform arrangement. The boarding platform would allow for ten-car trains. The primary entrance to the station house would be ADA accessible.

Each station option would include a bus terminal with four bus bays and an overhead canopy. Buses would queue directly outside the primary entrance of the station to provide the closest possible connection between the rail line and bus routes. An auto drop-off area would be located near the station house in addition to a park & ride facility. Secure, weather-protected bicycle parking would be provided.

2.2.2.4.1 South Station Option

The South Station Option site would be between the MWRD facility (on the west) and the NICTD/CSS & SBRR rail track (on the east), using a portion of the Indiana Harbor Belt alignment. There would be a primary station entrance north of 130th Street at 130th Place, and an auxiliary entrance south of 130th Street between 130th Street and Doty Avenue; the tracks and platforms would extend beneath 130th Street. The ADA-accessible auxiliary entrance on Doty Avenue would provide a more convenient and direct access to Altgeld Gardens and Carver Military Academy.

The South Station Option site is constrained due to its tight location between the MWRD drying ponds and the train tracks. The parking area would be located to the east of the existing MWRD fence. The parking area would be would consist of a multi-story parking garage with capacity for 2,300 vehicles.

Bus and vehicle traffic would enter and leave the station area from the current intersection of 130th Street and Cottage Grove Avenue. Cottage Grove Avenue, which primarily provides access to the MWRD drying ponds and semi-truck traffic, would be relocated to circulate around the station.

2.2.2.4.2 West Station Option

The West Station Option site would be on the north side of 130th Street across from Evans Avenue, nearly ¼ mile west of the South Station Option site. The site is west of where Evans Avenue meets 130th Street, across from Altgeld Gardens. The West Station Option site is nearly twice the size of the South Station Option site, primarily due to available open land along the north side of 130th Street, south of the MWRD facility. The dimensions of the station, bus terminal, and surface parking areas would be similar in total area to those in the South Station Option. The station area would be located outside the existing MWRD fence. Parking would include a surface parking lot that could accommodate up to 350 parking spaces and a multi-storage garage that could accommodate 1,950 parking spaces.

There are no crosswalks on 130th Street between Indiana Avenue and Cottage Grove Avenue. As a result, a signal and pedestrian crosswalk is proposed at the intersection of 130th Street and Evans Avenue to accommodate pedestrians from the south side of 130th Street. The proposed pedestrian crossing and signalized intersection would be located south of the primary station entrance.

2.2.3 120th Street Yard and Shop

A yard (with capacity for up to 340 cars) and shop facility would be located on a combination of industrial and vacant land to the east of the CN/Metra Electric tracks and west of the NICTD/CSS & SBRR tracks at approximately 120th Street and Cottage Grove. The yard would be entirely at grade. A nominal amount of parking for employees would be included at the yard. The proposed yard location is shown in Figure 2-2. A tentative substation is proposed within the 120th Street yard on the west of the existing railroad tracks and to the east of the proposed shop facility.

2.3 Halsted Rail Alternative

The proposed Halsted Rail Alternative is a 5-mile extension of the existing Red Line. The Red Line would operate on an elevated structure heading south from 95th Street along I-57 until Halsted Street. It would then turn south and continue along Halsted Street past the intersection of Halsted Street and Vermont Avenue and end near 129th Street. Four stations are planned: for 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Halsted Rail Alternative is illustrated in Figure 2-4.

Figure 2-6: Typical Straddle Bent Cross-Section for Halsted Rail Alternative

The proposed typical structure required for the elevated section is anticipated to be similar to sections on the CTA's elevated Orange Line. Spans between piers are expected to typically be 60 to 100 feet, and as long as 140 feet. Span length is based on site conditions, geometries, and clearance requirements. At specific locations, steel cross girder bents would be used. Lengths would be based on geometries, horizontal clearances, and the use of pier protection crash walls per American Railway Engineering and Maintenance-of-Way (AREMA) manual.

The substructure would consist of reinforced cast-in-place concrete hammerhead piers on drilled shafts or steel piles. The superstructure would consist of steel girders with a concrete deck supporting direct fixation track. Crossing I-57 at Halsted Street, the profile height would be approximately 22 feet over Halsted Street pavement, and approximately 34 feet over the expressway.

Minimum vertical clearances would be 14 feet 9 inches above local roads and 16 feet 6 inches above urban expressways. At locations where the Halsted Rail alignment would cross the UPRR, the minimum vertical clearance would be 23 feet 4 inches, per the UPRR standards. The minimum vertical clearance for the Metra Electric tracks would be 23 feet zero inches per AREMA standards.

Substations are proposed at the following locations: the northeast corner at the intersection of 101st Street and Halsted Street, the southeast corner at the intersection of 110th Street and Halsted Street, along Halsted Street between 120th Street and Metra Electric tracks, the southeast corner at the intersection of 126th Street and Halsted Street, and at the entrance to the yard along Peoria Street.

2.3.2 Stations

Four stations are proposed for the Halsted Rail Alternative: 103rd Street, 111th Street, 119th Street, and Vermont Avenue. All stations are proposed as side platforms, each a minimum of 14 feet wide and 520 feet long with shelters. Bus and park & ride facilities are planned for all stations. The anticipated number of parking spots is provided in Table 2-4.

Table 2-4: Halsted Rail Alternative Park & Ride Facilities

Location	Construction Year	Horizon Year (2030)
103rd Street	200	200
111th Street	200	200
119th Street	200	1,000
Vermont Avenue	900	2,300
Total	**1,500**	**3,700**

2.3.2.1 103rd Street Station

Station entrances to the 103rd Street station would be located on the east and west sidewalks of Halsted Street at the intersection with 103rd Street. The primary station entrances would be north of the intersection and the auxiliary entrances would be south of the intersection. Each entrance area would be on street level and would contain an elevator and stairs.

The 103rd Street station would have a park & ride lot on the northwest parcel adjacent to the station at the intersection of 103rd Street and Halsted Street. This lot would provide approximately 200 new parking spaces. A bus turnaround for CTA bus route #9 would be included at the northeast parking lot.

2.3.2.2 111th Street Station

Station entrances to the 111th Street station would be located on the east and west sidewalks of Halsted Street at the intersection with 111th Street. The primary station entrances would be north of the intersection and the auxiliary entrances would be south of the intersection. Each entrance area would be on street level and would contain an elevator and stairs.

The 111th Street station would have a park & ride lot on the northwest parcel adjacent to the station at the intersection of 111th Street and Halsted Street. This lot would provide approximately 200 new parking spaces.

2.3.2.3 119th Street Station

Station entrances to the 119th Street station would be located on the east and west sidewalks of Halsted Street between 118th Street and 119th Street. The primary station entrances would be north of 119th Street and the auxiliary entrances would be south of 118th Street. Each entrance area would be on street level and would contain an elevator and stairs.

The 119th Street station would have a new multi-story park & ride facility that would hold approximately 1,000 parking spaces. The lot would be on the southwest parcel at the intersection of 119th Street and Halsted Street. A bus turnaround for Pace bus route #359 would be included at the parking lot.

2.3.2.4 Vermont Avenue Station

Station entrances to the Vermont Avenue station would be located on the east and west sidewalks of Halsted Street between the 128th Street and Vermont Avenue. The primary station entrances would be south of Vermont Avenue and the auxiliary entrances would be north of 128th Street. Each entrance area would be on street level and would contain an elevator and stairs.

The Vermont Avenue station would have a new, multi-story park & ride facility with approximately 2,300 parking spaces. The lot would be located on the south side of the intersection of Halsted and Vermont Avenues. The ground level of the parking garage would be available for CTA office space as well as retail and/or community facilities. Bus bays for CTA bus route #8A and Pace routes #348 and #352 would be included at the station.

2.3.3 119th Street Yard and Shop

The 119th Street yard and shop would be located south of the 119th Street station and north of the Vermont Avenue station to the west of Halsted Street. The parcel on which the yard would be constructed is west of the proposed park & ride facility at the 119th Street station. Track height would transition from elevated at station height to at grade between Halsted Street and Morgan Street, through the proposed park & ride facility. The yard would be entirely at grade. A nominal amount of parking for employees would be included at the yard. The location of the proposed yard is shown in Figure 2-4.

The 98th Street yard and shop at the south end of the existing Red Line would continue to be used for Red Line trains. The CTA is considering utilizing the existing 98th Street shop for non-revenue equipment repairs once a new revenue equipment shop is constructed at 119th Street.

Section 3
Description of Construction

3.1 Construction Phasing and Segments

Section 3.3 describes the anticipated construction activities and methods of construction. Please refer to Section 3.3 for more details regarding construction methods. The estimated quantities and potential equipment are summarized in Attachment A.

3.1.1 Construction Assumptions For All Alternatives

The following are the major constructability, construction sequencing, and phasing assumptions. Phasing and construction segments may change due to refined engineering, available funding, and other factors later in the project implementation stage.

3.1.1.1 Constructability Assumptions

The coordinated construction of infrastructure and stations is a key component of planning and design. Assumptions that affect design solutions include the following:

- Ultimate station, park & ride facility, and yard locations.
- Ultimate aerial structure type. New construction of elevated structure includes foundation, columns, superstructure, and deck. New construction of retained fill structures includes foundation and two parallel reinforced concrete retaining walls with fill in between.
- The ability to construct facilities in sequences and phases to facilitate CTA operations, specifically around the 95th Street Terminal and 98th Street yard and shop. This includes systems (trackwork, traction power, signals and communications).
- The ability to construct facilities in sequences and phases to facilitate UPRR operations.
- The location and size of proposed foundations and structural members, potentially limited by clearance requirements (e.g., caisson size and depth, concrete pour access, steel piece weight and size, etc.)
- The ability to construct structures in sequences and phases to facilitate vehicular traffic operations on I-94 and 1-57.

The following parameters have been assumed for all build alternatives:

- The methods of construction required along the proposed alignments are anticipated to be conventional, utilizing standard construction methods and materials including cast-in-place concrete, pre-cast concrete, and structural steel.

- Streets with adjacent alleys would be used for site access during construction. New construction in and around the 95th Street Terminal would require some tracks to be taken out of service or realigned to access and perform the work. To perform this work in an efficient manner while maintaining reasonable service and access to the 98th Street yard and shop, it is anticipated that construction would be sequenced and phased to maintain access to the 98th Street yard and shop.

- Space for storage and staging of construction materials, equipment, and temporary facilities would be needed within and/or adjacent to the ROW. Construction material storage and contractor yard areas appear to be available along the alignments through a combination of publicly owned and privately owned properties. Construction access adjacent to the ROW could be required, especially during embankment, viaduct, and station construction durations.

- During construction, access to work zones adjacent to the expressway would require shoulder and lane closures. For the superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per Illinois Department of Transportation (IDOT) approval. Construction adjacent to or over railroads would require flagging operations and scheduled track closures.

- It is anticipated that streets crossed by stations and viaducts, along with adjacent alleys, would be closed temporarily or the number of travel lanes would be reduced during heavy construction. Viaduct construction activities, along with all construction access, would be centered upon or phased around these streets and alleys.

Prior to construction, advance work would be necessary to verify existing site conditions, relocate and protect utilities, provide any temporary modifications to signal systems including the 95th Street Terminal as well as along or across any viaduct or roadway crossings, and provide special or temporary trackwork at required construction interface zones.

Constructability is a key issue that must be coordinated with the design to ensure the ability to construct facilities in sequences and phases as required in facilitating CTA, UPRR, and highway operations.

3.1.2 BRT Alternative

3.1.2.1 Construction Segments

Construction activities would be grouped by type of work and location. Overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street yard and shop, and vehicular traffic on affected expressways and roadways. Construction for the single segment could be sequenced to coordinate with CTA operations at the 95th Street Terminal.

The corridor is divided into one segment for the purposes of describing construction activities. The construction segment for the BRT Alternative is shown on Figure 3-1. The conceptual engineering plans for the alternative have been provided separately.

3.1.2.2 Construction Phasing

Work activities within the single segment for the BRT Alternative are described below.

Segment BRT-B-1: From the 95th Street Terminal to the Eberhart Avenue stop.

Work Activities

- New construction of BRT shelters and amenities at BRT stops
- New construction of park & ride facilities
- New construction of pavement markings and crosswalks
- New construction of signage
- New construction of sidewalk improvements at BRT stops
- New construction of ADA-compliant ramps at BRT stops
- New construction of bus pads at BRT stops
- New construction of lighting at BRT stops
- New construction of a traffic signal at the 130th Street/Eberhart Avenue intersection
- New construction of transit signal priority detectors and improvement of traffic signal controllers at existing signalized intersections
- Utility relocation or new construction at BRT stops, park & ride facilities, and signalized intersections
- Removal of on-street parking spaces at BRT stops

Construction Phasing

All of the construction work activities may require temporary shutdown of traffic. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per IDOT approval. Work zones along the BRT Alternative would likely require temporary lane closures. Work would be sequenced to minimize impacts on adjacent roadways and both commercial and residential buildings.

Existing utilities would be protected during construction of the BRT stations, park & ride facilities, and traffic signal improvements.

3.1.3 UPRR Rail Alternative

3.1.3.1 Right-Of-Way Option

3.1.3.1.1 Construction Segments

Construction activities would be grouped by type of work and location. Overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street yard and shop, and vehicular traffic on affected expressways and roadways. Special or temporary trackwork may be required between the 95th Street Terminal and the 98th Street yard and shop. Construction for single segments or groups of adjacent segments could be sequenced to coordinate with CTA operations at the 95th Street Terminal.

The corridor is divided into seven segments for the purposes of describing construction activities. The construction segments discussed in the proceeding sections do not correspond to Segments UA and UB that are being used in the environmental analysis for the UPRR Rail Alternative. Segments UA and UB are described in the *Description of Alternatives*. Construction segments for the three UPRR Rail Alternative Options are shown on Figure 3-1. The conceptual engineering plans for each of the alternatives and options have been provided separately.

Figure 3-1: RLE Alternatives Construction Segment Map

3.1.3.1.2 Construction Phasing

Work activities within the eight segments for the ROW Option are described below.

Segment UPRR-ROW-U-1: From the 95th Street Terminal to the beginning of the horizontal curve at the UPRR crossing (approximate stationing 96+60 to 132+00)

Work Activities

- New trackwork and signals to tie into the 95th Street Terminal.
- Possible relocation of trackwork between 95th Street Terminal and the 98th Street yard and shop.
- New construction of retained fill structure south of 95th Street Terminal.
- New construction of single track, elevated structures over existing CTA tracks leading to the 98th Street yard and shop and over the existing CTA/SB 1-94 tunnel.
- New construction of dual track, elevated structure through the I-94/I-57 interchange, across the westbound (WB) I-57 entrance ramp from northbound (NB) I-94, and along the I-57 corridor.
- Proposed structure construction would be sequenced to minimally affect traffic flow on the WB I-57 entrance ramp from NB I-94. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per IDOT approval.

Construction Phasing

It may be necessary to relocate trackwork leading from the 95th Street Terminal to the 98th Street yard and shop to allow construction of proposed substructure within CTA ROW. Tying proposed trackwork and structure into existing trackwork at the 95th Street Terminal would be sequenced to provide rail car access to the 98th Street yard and shop. Proposed structure construction would be sequenced to maintain operating routes from the 95th Street Terminal to the 98th Street yard and shop as well as maintain traffic flow on I-94 through the tunnel.

Superstructure erection over the CTA tracks, I-94, the WB I-57 entrance ramp from NB I-94, and Wentworth Avenue would require temporary shutdown of CTA non-revenue operations and traffic. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per IDOT approval. CTA non-revenue operations would be shutdown during off-peak hours or weekends. Work would be sequenced to minimize impacts on traffic flow on the I-57/I-94 interchange as well as in the I-57 corridor. Work zones adjacent to the expressway would require shoulder and probably lane closures.

The existing 6.5-foot-diameter sewer underneath both 99th Street and 102nd Street would be protected during construction. See Section 3.4 for more information regarding the protection of utilities during construction.

Segment UPRR-ROW-U-2: The horizontal curve at the UPRR crossing (approximate stationing 132+00 to 142+19)

Work Activities

- New construction of dual track, elevated structure consisting of multiple types of superstructure and substructure spanning along and across I-57 and within the UPRR corridor

Construction Phasing

Work would be sequenced to minimize impacts on traffic flow on I-57. Work zones adjacent to the expressway would require temporary shoulder and lane closures. Superstructure erection over I-57 would require temporary shutdown of northbound traffic.

The existing 10-foot-diameter Stewart Avenue water tunnel would be protected during construction of the foundations. See Section 3.4 for more information regarding the protection of utilities during construction.

Segment UPRR-ROW-U-3: From the end of the horizontal curve at the UPRR crossing to the CN/Metra Electric crossing (approximate stationing 142+19 to 286+12)

Work Activities

- New construction of elevated structure within the UPRR corridor
- New station construction at 103rd Street, 111th Street, and 115th Street
- New construction of surface parking lots and bus turnarounds at 103rd Street station and 111th Street station and new construction of a structured parking lot and bus turnaround at 1115th Street station
- New construction of two substations (approximate stationing 174+50 and 254+50)

Construction Phasing

Signaling would need to be replaced following construction of viaducts for the following at-grade UPRR crossings: 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, 115th Street, and State Street.

All existing structures and underground utilities will be identified. All existing utilities would be protected or relocated. The following known existing utilities and structures would be protected during construction activities. Section 3.4 discusses methods for protecting nearby utilities and structures.

- 10-foot-diameter Stewart Avenue water tunnel
- Roseland Pumping Station and the associated underground pipes and vaults
- 10-foot-diameter sewer underneath Wentworth Avenue near 114th Street
- 17.5 foot, horseshoe shaped, MWRD Calumet Intercepting Sewer tunnel

Segment UPRR-ROW-U-4: From the CN/Metra Electric crossing to at-grade track (approximate stationing 286+12 to 310+03)

Work Activities

- New construction of dual track, elevated structure within the UPRR corridor, branching off and running along the east side of the corridor and over CN/Metra Electric
- New construction of elevated structure to 120th Street yard and shop track tie-in
- New construction of retained embankment structure to carry elevated structure to grade

Construction Phasing

Construction at the CN/Metra Electric crossing would be phased to minimize impacts on CN and Metra operations. Construction over and adjacent to the railroads would require flagging operations and potential limited track closures.

Segment UPRR-ROW-U-5: From at-grade track to the beginning of 130th Street station options (approximate stationing 310+03 to 360+02)

Work Activities

- Removal of Norfolk Southern Railway and Consolidated Rail Corporation right-of-way tracks. New construction of track roadbed at grade (including removal of any unsuitable soils, as applicable).
- New construction of the MWRD access road and bridge over the proposed CTA tracks and the NICTD/CSS & SBRR crossing (approximate stationing 357+00)

Construction Phasing

Coordination with MWRD is necessary to maintain operations during new track roadbed construction. If necessary, construction would be sequenced to construct the proposed access road and bridge over the CTA tracks first to allow MWRD facilities to continue operation.

Coordination with the NICTD/CSS & SBRR would be necessary as construction over and adjacent to the railroads would require flagging operations and scheduled track closures.

Segment UPRR-ROW-U-6S: South Station Option (approximate stationing 360+02 to 380+29)

Work Activities

- New construction of track roadbed
- New construction of the 130th Street station
- New construction of parking lots and a multi-story garage for the 130th Street station
- New construction for land development, bus bays, and road access for the 130th Street station
- New construction of the MWRD access road to 130th Street
- New construction of a substation (approximate stationing at 365+60)

Construction Phasing

Coordination with MWRD would be necessary to maintain current operations during new track roadbed construction and during the new road access for the 130th Street station. If necessary, construction would be sequenced to construct the proposed MWRD access road to the west of the proposed station first, allowing MWRD facilities to continue operation. Coordination with the NICTD/CSS & SBRR is also necessary as construction over and adjacent to the railroads would require flagging operations and scheduled track closures.

Segment UPRR-ROW-U-6W: West Station Option (approximate stationing 380+29 to 395+40)

Work Activities

- New construction of track roadbed
- New construction of the 130th Street station
- New construction of parking lots and a multi-story garage for 130th Street station
- New construction for land development, bus bays, and road access for the 130th Street station
- New construction of the MWRD access road and bridge to 130th Street
- New construction of a substation (approximate stationing at 375+50)
- New construction of crosswalks and signalized intersection at 130th Street and Evans Avenue

Construction Phasing

Coordination with MWRD would be necessary to maintain current operations during new track roadbed construction and during the new road access for the 130th Street station. If necessary, construction would be sequenced to construct the proposed MWRD access road and bridge crossing the proposed CTA tracks near station 371+00 first, allowing MWRD facilities to continue operation. Coordination with the NICTD/CSS & SBRR is also necessary as construction over and adjacent to the railroads would require flagging operations and scheduled track closures.

Segment UPRR-ROW-U-7: 120th Street yard and shop (approximate stationing 291+85/45+00 to 352+69/106+12)

See Section 3.2 for construction phasing and group information.

3.1.3.2 East Option

3.1.3.2.1 Construction Segments

Construction activities would be grouped by type of work and location. Overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street yard and shop, and vehicular traffic on affected expressways and roadways. Special or temporary trackwork may be required between the 95th Street Terminal and the 98th Street yard and shop. Construction for single segments or groups of adjacent segments could be sequenced to coordinate with CTA operations at the 95th Street Terminal.

The corridor is divided into seven segments for the purposes of describing construction activities. Construction segments for the three UPRR Rail Alternative Options are shown on Figure 3-1.

3.1.3.2.2 Construction Phasing

Work activities within the eight segments for the East Option are described below.

Segment UPRR-E-U-1: From the 95th Street Terminal to the beginning of the horizontal curve at the UPRR crossing (approximate stationing 96+60 to 132+00)

Work activities (same as Segment UPRR-ROW-U-1)

- New trackwork and signals to tie into the 95th Street Terminal. Possible relocation of trackwork between the 95th Street Terminal and the 98th Street yard and shop.
- New construction of retained fill structure south of 95th Street Terminal.
- New construction of single track, elevated structures over existing CTA tracks leading to the 98th Street yard and shop and over the existing CTA/southbound (SB) I-94 tunnel.
- New construction of dual track, elevated structure through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and within the I-57 corridor.

- Proposed structure construction would be sequenced to minimally affect traffic flow on the WB I-57 entrance ramp from NB I-94. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per IDOT approval.

Construction Phasing (same as Segment UPRR-ROW-U-1)

It will be necessary to relocate trackwork leading from the 95th Street Terminal to the 98th Street yard and shop to allow construction of proposed substructure within CTA ROW. Tying proposed trackwork and structure into existing trackwork at 95th Street Terminal would be sequenced to provide rail car access to 98th Street yard. Proposed structure construction would be sequenced to maintain operating routes from 95th Street Terminal to 98th Street yard and maintain traffic flow on I-94 through the tunnel.

Superstructure erection over the CTA tracks, I-94, the WB I-57 entrance ramp from NB I-94, and Wentworth Avenue would require temporary shutdown of CTA non-revenue operations and traffic. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per IDOT approval. Work would be sequenced to minimize impacts on traffic flow on the I-57/I-94 interchange as well as in the I-57 corridor. Work zones adjacent to the expressway would require shoulder and probably lane closures. Work activities would also affect traffic flow on the north frontage road to I-57 (also called Lafayette Avenue and 98th Place).

The existing 6.5-foot-diameter sewer underneath both 99th Street and 102nd Street would be protected during construction. See Section 3.4 for more information regarding the protection of utilities during construction.

Segment UPRR-E-U-2: The horizontal curve at the UPRR crossing (approximate stationing 132+00 to 142+00)

Work Activities (same as Segment UPRR-ROW-U-2)

- New construction of dual track, elevated structure consisting of multiple types of superstructure and substructure spanning along and across I-57 and within the UPRR corridor

- For the East Option, this construction segment crosses the western portion of Wendell Smith Park

Construction Phasing

Work would be sequenced to minimize impacts on traffic flow on I-57 and UPRR operations. Work zones adjacent to the expressway may require temporary shoulder and lane closures. Superstructure erection over I-57 would require temporary shutdown of northbound traffic. Construction adjacent to railroads would require flagging operations and scheduled track closures.

The existing 10-foot-diameter Stewart Avenue water tunnel would be protected during construction of the foundations. See Section 3.4 for more information regarding the protection of utilities during construction.

The construction activities in the western portion of Wendell Smith Park would include construction of foundations, placement of beams, and construction of the superstructure. Activities require access of a variety of construction equipment, material delivery, haul trucks, and labor. Construction fencing would be required to separate activities occurring in the eastern portion of the park from the construction activities in the western portion.

Segment UPRR-E-U-3: From the end of the horizontal curve at the UPRR crossing to the CN/Metra Electric crossing (approximate stationing 142+00 to 285+00)

Work Activities

- Demolition of existing buildings and structures in the proposed ROW where necessary. The conceptual engineering plans and profiles (provided separately) show the proposed ROW and construction easements necessary to conduct this work.
- Demolition or relocation of the communication tower currently located in Block Park.
- New construction of dual track, elevated structure consisting of multiple types of superstructure and substructure along the east side of the UPRR corridor. New construction of elevated structure includes foundation, columns, and deck.
- New station construction of stations at 103rd Street, 111th Street, and 115th Street.
- New construction of surface parking lots and bus turnarounds at 103rd Street station and 111th Street station and new construction of a structured parking lot and bus turnaround at 115th Street station.
- New construction of two substations (approximate stationing 174+30 and 253+60) with ductbanks to be constructed beneath the UPRR tracks.
- UPRR at-grade crossing gate and signal infrastructure replacement at seven crossings.

Construction Phasing

Work would be sequenced along the UPRR corridor to minimize impacts on UPRR operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Flagging operations would be needed to replace existing at-grade crossing gates and signals during construction of viaducts for the following at-grade UPRR crossings: 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, 115th Street, and State Street.

All existing structures and underground utilities will be identified. All existing utilities will be protected or relocated. The following known existing utilities and structures would be protected during construction activities:

- 10-foot-diameter Stewart Avenue water tunnel along the UPRR corridor
- Former Griffith Natatorium
- Roseland Pumping Station and the associated underground pipes and vaults
- 10-foot-diameter sewer underneath Wentworth Avenue near 114th Street
- 17.5 foot, horseshoe shaped, MWRD Calumet Intercepting Sewer tunnel

Segment UPRR-E-U-4: From the CN/Metra Electric crossing to at-grade track (approximate stationing 285+00 to 308+83)

Work Activities

- Demolition of existing buildings and structures in the proposed ROW where necessary. The conceptual engineering plans and profiles (provided separately) show the proposed ROW and construction easements necessary to conduct this work.
- New construction of dual track, elevated structure along the east side of the UPRR corridor and over the CN/Metra Electric tracks. Construction of track bed may include removal of unsuitable soils (as applicable).
- New construction of CTA yard and shop and substation construction.
- New construction of retained embankment structure to carry elevated structure to grade.

Construction Phasing

Construction at the CN/Metra Electric crossing would be phased to minimize impacts on CN and Metra operations. Construction over and adjacent to the railroads would require flagging operations and potential limited track closures.

Segment UPRR-E-U-5: From the at-grade track to the beginning of the 130th Street station options (approximate stationing 308+83 to 359+00)

Same as Segment UPRR-ROW-U-5. See Section 3.1.3.1 Segment UPRR-ROW-U-5 for more information.

Segment UPRR-E-U-6S: South Station Option (approximate stationing 359+00 to 379+27)

Work Activities (same as Segment UPRR-ROW-U-6S)

- Remove Norfolk Southern Railway and Consolidated Rail Corporation right-of-way tracks. New construction of track roadbed (including removal of any unsuitable soils as applicable) and systems elements
- New construction of the 130th Street station
- New construction of the parking lot and multi-story garage for 130th Street station
- New construction for land development, bus bays, and road access for the 130th Street station
- New construction for the MWRD access road to 130th Street
- New construction of a substation (approximate stationing at 365+60)

Construction Phasing (same as Segment UPRR-ROW-U-6S)

Coordination with MWRD would be necessary to maintain current operations during new track roadbed construction and during the new road access for the 130th Street station. If necessary, construction would be sequenced to construct the proposed MWRD access road to the west of the proposed station first, allowing MWRD facilities to continue operation. Coordination with the NICTD/CSS & SBRR would be necessary as construction over and adjacent to the railroads would require flagging operations and scheduled track closures. Construction of access roads will require temporary shoulder and lane closures.

Segment UPRR-E-U-6W: West Station Option (approximate stationing 379+27 to 394+38)

Work Activities (same as Segment UPRR-ROW-U-6W)

- New construction of track roadbed
- New construction of the 130th Street station
- New construction of parking for the 130th Street station
- New construction for land development, bus bays, and road access for the 130th Street station
- New construction of the MWRD access road and bridge to 130th Street
- New construction of a substation (approximate stationing at 375+50)
- New construction of crosswalks and signalized intersection at 130th Street and Evans Avenue

Construction Phasing (same as Segment UPRR-ROW-U-6W)

Coordination with MWRD would be necessary to maintain current operations during new track roadbed construction and during the new road access for the 130th Street station. If necessary, construction would be sequenced to construct the proposed MWRD access road and bridge crossing proposed CTA tracks (approximate stationing 370+00) first, allowing MWRD facilities to continue operation. Coordination with the NICTD/CSS & SBRR would be necessary as construction over and adjacent to the railroads would require flagging operations and scheduled track closures

Segment UPRR-E-U-7: 120th Street yard and shop (approximate stationing 290+26/45+00 to 351+67/106+79)

See Section 3.2 for construction phasing and group information for the 120th Street yard and shop.

3.1.3.3 West Option

3.1.3.3.1 Construction Segments

Construction activities would be grouped by type of work and location. Overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street yard and shop, and vehicular traffic on affected expressways and roadways. Special or temporary trackwork may be required between the 95th Street Terminal and the 98th Street yard and shop. Construction for single segments or groups of adjacent segments could be sequenced to coordinate with CTA operations at the 95th Street Terminal.

The corridor is divided into seven segments for the purposes of describing construction activities. Construction segments for the three UPRR Rail Alternative Options are shown on Figure 3-1.

3.1.3.3.2 Construction Phasing

Work activities within the segments for the West Option are described below.

Segment UPRR-W-U-1: From the 95th Street Terminal to the beginning of the horizontal curve at the UPRR crossing (approximate stationing 96+60 to 132+00)

Work Activities (same as Segment UPRR-ROW-U-1)

- New trackwork and signals to tie into the 95th Street Terminal.
- Modifications of trackwork traction power and signals between the 95th Street Terminal and the 98th Street yard and shop.
- New construction of retained fill structures south of 95th Street Terminal.
- New construction of single track, elevated structures over existing CTA tracks leading to the 98th Street yard and shop and over the existing CTA/SB I-94 tunnel. New construction of dual

track, elevated structure through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94 and along the I-57 corridor.

- Proposed structure construction would be sequenced to minimally affect traffic flow on the WB I-57 entrance ramp from NB I-94. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required.

Construction Phasing (same as Segment UPRR-ROW-U-1)

It will be necessary to relocate trackwork leading from the 95th Street Terminal to the 98th Street yard and shop to allow construction of proposed substructure within CTA ROW. Tying proposed trackwork and structure into existing trackwork at 95th Street Terminal would be sequenced to provide rail car access to 98th Street yard and shop. Proposed structure construction would be sequenced to maintain operating routes from the 95th Street Terminal to the 98th Street yard and shop and maintain traffic flow on I-94 through the tunnel.

Superstructure erection over CTA tracks and I-94, the I-57 ramp, and Wentworth Avenue would require temporary shutdown of operation and traffic. Work would be sequenced to minimize impacts on traffic flow on the I-57/I-94 interchange as well as in the I-57 corridor. Work zones adjacent to the expressway would require shoulder and probably lane closures. Work activities would also affect traffic flow on the north frontage road to I-57 (also called Lafayette Avenue and 98th Place).

The existing 6.5-foot-diameter sewer underneath 99th Street and 102nd Street would be protected during construction. See Section 3.4 for more information regarding the protection of utilities during construction.

Segment UPRR-W-U-2: Horizontal curve at the UPRR crossing (approximate stationing 132+00 to 142+43)

Work Activities (same as Segment UPRR-ROW-U-2)

- New construction of dual track, elevated structure consisting of multiple types of substructure spanning along and across I-57 and the UPRR corridor

Construction Phasing

Work zones adjacent to the expressway and Eggleston Avenue may require temporary shoulder and lane closures. Superstructure erection over I-57 would require temporary shutdown of northbound traffic. Construction adjacent and across railroads would require flagging operations and scheduled track closures.

The existing 10-foot-diameter Stewart Avenue water tunnel would be protected during foundation construction. See section 3.4 for more information regarding the protection of utilities during construction.

Segment UPRR-W-U-3a: From the end of the horizontal curve at the UPRR crossing to the Prairie Street crossing (approximate stationing 142+43 to 275+00)

Work Activities

- Demolition of existing buildings and structures in the proposed ROW where necessary. The conceptual engineering plans and profiles (provided separately) show the proposed ROW and construction easements.
- New construction of dual track, elevated structure along the west side of the UPRR corridor.
- New construction of stations at 103rd Street, 111th Street, and Michigan Avenue.
- New construction of surface parking lots and bus turnarounds at 103rd Street station and 111th Street station and new construction of a structured parking lot and bus turnaround at 115th Street station.
- New construction of two substations and ductbanks beneath the UPRR ROW (approximate stationing 179+00 and 256+00).

Construction Phasing

Work would be sequenced along the UPRR corridor to minimize impacts on UPRR operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Flagging operations would be needed to replace existing at-grade crossing gates and signals during construction of viaducts for the following at-grade UPRR crossings: 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, 115th Street, and State Street.

The underground pipes and vaults associated with the Roseland Pumping Station and the 10-foot-diameter sewer underneath Wentworth Avenue near 114th Street would be protected during construction.

Segment UPRR-W-U-3b: From the Prairie Street crossing to the CN/Metra Electric crossing (approximate stationing 275+00 to 287+20)

Work Activities

- New construction of dual track, elevated structure along the east and west side of the UPRR corridor as well as across the UPRR tracks would consist of multiple types of super- and substructure spanning along and across the UPRR corridor and Prairie Avenue.

Construction Phasing

Work would be sequenced along and across the UPRR corridor to minimize impacts on UPRR operations. Construction adjacent to railroads would require flagging operations and scheduled track closures. Work zones adjacent to Prairie Avenue may require lane closures and may cause temporary shutdown of all traffic.

The existing 17.5 foot, horseshoe shaped, MWRD Calumet Intercepting Sewer tunnel would be protected during construction.

Segment UPRR-W-U-4: From the CN/Metra Electric crossing to at-grade track (approximate stationing 287+20 to 311+02)

Work Activities

- Demolition of existing buildings and structures in the proposed ROW where necessary. The conceptual engineering plans and profiles (provided separately) show the proposed ROW and the construction easements.
- New construction of dual track, elevated structure along the east side of the UPRR corridor and over the CN/Metra Electric tracks.
- New construction of 120th Street yard and shop track tie-in and substation.
- New construction of retained embankment structure to carry elevated structure to grade.

Construction Phasing

Construction at the CN/Metra Electric crossing would be phased to minimize impacts on CN and Metra operations. Construction over and adjacent to the railroads would require flagging operations and potential limited track closures.

Segment UPRR-W-U-5: From the at-grade track to the beginning of the 130th Street station options (approximate stationing 311+02 to 361+19)

Same as Segment UPRR-ROW-U-5. See Section 3.1.3.1 Segment UPRR-ROW-U-5 for more information.

Segment UPRR-W-U-6S: South Station Option (approximate stationing 361+19 to 381+46)

Same as Segment UPRR-ROW-U-6S. See Section 3.1.3.1 Segment UPRR-ROW-U-6S for more information.

Segment UPRR-W-U-6W: West Station Option (approximate stationing 381+46 to 396+57)

Same as Segment UPRR-ROW-U6W. See Section 3.1.3.1 Segment UPRR-ROW-U-6W for more information.

Segment UPRR-W-U-7: 120th Street yard and shop (approximate stationing 292+45/45+00 to 353+86/106+79)

See Section 3.1.3.4 description of construction for the 120th Street yard and shop.

3.1.3.4 120th Street Yard and Shop

Overall schedule and coordination of construction for the 120th Street yard and shop would be scheduled in order to maintain operations at the MWRD facilities.

Work Activities

- Preparation of site (including removal of unsuitable soils, as applicable) and installation of drainage systems.
- Construction of the new yard and trackwork
- Construction of the new shop building
- Construction of the yard and shop access roads and parking
- Construction of new substation (approximate stationing at 320+90)

Construction Phasing

Work would be sequenced to minimize impacts on adjacent roadways and both commercial and residential buildings.

3.1.4 Halsted Rail Alternative

3.1.4.1 Construction Segments

Construction activities would be grouped by type of work and location. Overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street yard and shop, and vehicular traffic on affected expressways and roadways. Special or temporary trackwork may be required between the 95th Street Terminal and the 98th Street yard and shop. Construction for single segments or groups of adjacent segments could be sequenced to coordinate with CTA operations at the 95th Street Terminal.

The corridor is divided into five segments for the purposes of describing construction activities. Construction segments for the Halsted Alternative are shown on Figure 3-1. The construction segments discussed in the proceeding sections do not correspond to Segments HA and HB that are being used in the environmental analysis for the Halsted Rail Alternative. Segments HA and HB are described in the *Description of Alternatives*.

3.1.4.2 Construction Phasing

Work activities within the five segments for the Halsted Alternative are described below.

Segment H-1: From the 95th Street Terminal to the beginning of the horizontal curve at the I-57 crossing (approximate stationing 96+60 to 158+00)

Work Activities

- New trackwork and signals to tie into the 95th Street Terminal. Possible relocation of trackwork between the 95th Street Terminal and the 98th Street yard and shop.
- New construction of retained fill structure south of 95th Street Terminal.
- New construction of single track, elevated structures over the existing CTA tracks leading to the 98th Street yard and shop and over the existing CTA/SB I-94 tunnel.
- New construction of dual track, elevated structure through the I-94/I-57 interchange, across the WB I-57 entrance ramp from NB I-94, and along the I-57 corridor.
- Proposed structure construction would be sequenced to minimally affect traffic flow on the WB I-57 entrance ramp from NB I-94. For superstructure erection over expressway traffic lanes, temporary shutdown of all traffic would be required. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per IDOT approval.

Construction Phasing

It may be necessary to relocate trackwork leading from the 95th Street Terminal to the 98th Street yard and shop to allow construction of proposed substructure within CTA ROW. Tying proposed trackwork and structure into existing trackwork at 95th Street Terminal would also be sequenced to provide rail car access to 98th Street yard and shop. Proposed single track, elevated structure construction would be sequenced to maintain CTA operation between the 95th Street Terminal and the 98th Street yard and shop as well as to maintain vehicular traffic flow on I-94 through the tunnel. Superstructure erection over the existing CTA/SB I-94 tunnel would require temporary shutdown of vehicular traffic and CTA non-revenue operations to and from the 98th Street yard and shop.

Work would be sequenced to minimize impacts on traffic flow on the I-57/I-94 interchange, in the I-57 corridor, and in the I-57 corridor. Work zones adjacent to the expressway would require shoulder and probably lane closures. Superstructure erection over the I-57 ramp and Parnell Avenue would require temporary shutdown of traffic. Temporary shutdown of traffic would occur at nighttime and low traffic volume intervals per IDOT approval. Superstructure erection over and construction near the UPRR structure would require flagging operations and scheduled track closures.

The existing 6.5-foot-diameter sewer underneath both 99th and 102nd Streets would be protected during construction. See Section 3.4 for more information regarding the protection of utilities during construction.

Segment H-2: The horizontal curve at the I-57 crossing (approximate stationing 158+00 to 168+00)

Work Activities

- New construction of dual track, elevated structure consisting of multiple types of super- and substructure spanning along and across I-57 and across Halsted Street

Construction Phasing

Work zones adjacent to and across the expressway may require shoulder and lane closures. Superstructure erection would require temporary shutdown of NB traffic on I-57 and at the intersection of 99th Street and Halsted Street.

Segment H-3: From the end of the horizontal curve at the I-57 crossing to 119th Street station (approximate stationing 168+00 to 285+00)

Work Activities

- New construction of dual track, elevated structure consisting of multiple types of substructure along the Halsted Street corridor
- New construction of stations at 103rd Street and 111th Street
- New construction of surface parking lot and bus turnaround at 103rd Street station
- New construction of surface parking lot at 111th Street station
- New construction of two substations (approximate stationing 175+00 and 237+00)

Construction Phasing

Work would be phased to minimize traffic impacts on Halsted Street and adjoining streets. Elevated structure construction would require lane and street closures. Parking would potentially be eliminated along Halsted Street during construction to increase traffic flow. Superstructure erection would require temporary shutdown of all traffic along segments of Halsted Street during off-peak or weekend hours. Traffic would be detoured to the next major north/south roadway to minimize traffic impacts. Detour routes for Halsted Street would be identified in a Maintenance of Traffic Plan as part of final engineering.

Segment H-4: From 119th Street station to Vermont Avenue station (approximate stationing 285+00 to 367+30)

Work Activities

- Work will be tied into adjacent improvements.
- New construction of dual track, elevated structure consisting of multiple types of substructure along the Halsted Street corridor.
- New construction of stations at 119th Street and Vermont Avenue.
- New construction of surface parking lot and bus turnaround at 119th Street station.
- New construction of both surface and structured parking lots as well as bus bays at Vermont Avenue station.
- New construction of two substations (approximate stationing 293+50 and 343+00).
- New construction of three track, elevated structure south of the Vermont Avenue station.

Construction Phasing

Work would be phased to minimize traffic impacts on Halsted Street and adjoining streets. Elevated structure construction would require lane and street closures. Parking would potentially be eliminated from Halsted during construction to increase traffic flow. Superstructure erection would require temporary shutdown of all traffic along Halsted Street. Detour routes for Halsted Street would be identified as part of final engineering.

Segment H-5: 119th Street Yard and Shop (approximate stationing 299+47/500+00 to 306+96/1014+64)

See Section 3.1.4.3 for construction phasing and group information for the 119th Street yard and shop.

3.1.4.3 119th Street Yard and Shop

For analysis of construction, the 119th Street yard and shop has been separated from the Halsted Rail segments.

Work Activities

- Demolition of existing buildings and structures in the proposed ROW where necessary
- Construction of the new yard and track
- Construction of the new shop building

- Construction of the yard and shop access road and parking

Construction Phasing

Work would be sequenced to minimize impacts on adjacent roadways and buildings.

3.2 Potential Construction Staging Areas

Construction staging would be within the proposed ROW or within construction easements of stations and alternative alignments as indicated on the plan and profile drawings (provided separately). Construction staging areas are required to function for the following basic use criteria:

- Provide access to the construction work for construction personnel. Staging areas would include areas for office trailers, subcontractor site trailers, personnel facilities, and similar.
- Provide access to the construction work for construction equipment. This would include on-site storage of equipment being used on a continuous basis.
- Provide room for the construction personnel and equipment to perform the construction work.
- Provide access for trucks and associated loading equipment to remove materials generated on site, such as demolition salvaged materials and debris and excavation spoils. This type of material handling typically requires on-site segregation and interim on-site storage.
- Provide access, if possible, to store excavated material acceptable for reuse on the site.
- Provide access to receive and store permanent construction materials such as backfill and sub-base aggregates, steel reinforcing bars, and structural steel.
- Provide access to receive and store temporary construction materials such as concrete forms, shoring materials, scaffolding, and excavation support items.

Each construction site would have specific attributes to be accommodated, including the design of the proposed structure, existing conditions such as adjacent structures, and limited access from both an off-site and an on-site perspective. A productive and useful site access plan, with actual known requirements, would be developed after the proposed structure design is complete and adjacent property site conditions are known. Construction access is a critical contractor requirement that directly equates to an efficient construction process.

While the specific design and adjacent land uses at the time of construction would ultimately dictate the access plan, the following provides a general description of the types of properties typically targeted for construction staging in order to minimize impacts:

- CTA-acquired parcels, obtained for increased future infrastructure envelopes. Whole parcels or groups of parcels may be acquired and utilized during construction. After construction, residual property may be sold.

- Nearby parking lots may be used through the establishment of temporary construction easements.

- Abandoned adjacent parcels may be used through the establishment of temporary construction easements.

Because of limited available space adjacent to the construction site, off-site CTA, municipal, or privately owned storage yards may need to be provided for the contractor's use. This would allow secure storage of an equipment fleet or permanent materials needing large storage or assembly areas.

Attempts to define required access limits may not prove to be effective at this time due to lack of a constructible design.

3.2.1 BRT Alternative

The BRT Alternative has been divided into one construction segment, as defined in Section 3.1.2.1. Segment BRT-B-1 consists of new construction from the 95th Street Terminal to the Eberhart Avenue stop. The construction of the BRT segment may require limited temporary construction easements on adjacent streets and on parcels, including parking lots, abandoned properties, and other adjacent properties.

3.2.2 UPRR Rail Alternative

3.2.2.1 ROW Option

The ROW Option has been divided into eight construction segments, as defined in Section 3.1.3.1.

Segment UPRR-ROW-U-1 consists of all new construction south of the 95th Street Terminal within the CTA ROW, over the CTA track/1-94 tunnel, the WB I-57 entrance ramp from NB I-94, and Wentworth Avenue structure within the I-57 corridor. These construction segments may require the following:

- Numerous temporary construction easements on the adjacent expressway, requiring shoulder and lane closures as well as temporary shutdown of traffic.

- Off-site construction materials storage yards, due to limited space adjacent to the construction site. Storage yards may be located on parcels acquired for the project in adjacent construction segments to minimize impacts on the surrounding neighborhoods and communities.

Segment UPRR-ROW-U-2 consists of all new construction along the I-57 corridor, across NB I-57 and along Wendell Smith Park. This construction segment may require the following:

- Numerous temporary construction easements on the adjacent expressway requiring shoulder and lane closures as well as temporary shutdown of traffic.
- Off-site construction materials storage yards due to limited space adjacent to the construction site. Storage yards may be located on parcels acquired for the project in adjacent construction segments to minimize impacts on the surrounding neighborhoods and communities.
- Numerous temporary construction easements on adjacent streets, parks, and parcels including parking lots, abandoned properties, and other adjacent properties.

Segment UPRR-ROW-U-3 consists of new construction along the east side of the UPRR corridor. This construction segment may require the following:

- Numerous temporary construction easements on adjacent streets, parks, and parcels including parking lots, abandoned properties, and other adjacent properties.

Segment UPRR-ROW-U-4 consists of new construction over the CN/Metra Electric tracks. This construction segment may require the following:

- CTA-acquired parcels would provide most required access needs.
- Temporary construction easements on adjacent parcels including abandoned properties, MWRD property, and other adjacent properties.

Segments UPRR-ROW-U-5, UPRR-ROW-U-6S, and UPRR-ROW-U-6W consist of new construction along the NICTD/CSS & SBRR tracks and in the vicinity of the 130th Street station option. These construction segments may require the following:

- CTA-acquired parcels would provide most required access needs.
- A limited amount of temporary construction easements on adjacent parcels including abandoned properties and MWRD property.

Staging requirements of Segment UPRR-ROW-U-7 are discussed in Section 3.2.3.

3.2.2.2 East Option

The East Option has been divided into eight construction segments, as defined in Section 3.1.3.2.

Possible staging area requirements for Segments UPRR-E-U-1 and UPRR-E-U-2 are the same as those for Segments UPRR-ROW-U-1 and UPRR-ROW-U-2, respectively.

Segment UPRR-E-U-3 may require more temporary construction staging areas than Segment UPRR-ROW-U-3 because the UPRR ROW provides space for construction needs.

Possible staging area requirements for Segments UPRR-E-U-4, UPRR-E-U-5, UPRR-E-U-6S, and UPRR-E-U-6W are the same as those for Segments UPRR-ROW-U-4, UPRR-ROW-U-5, UPRR-ROW-U-6S, and UPRR-ROW-U-6W, respectively.

Staging requirements of Segment UPRR-E-U-7 are discussed in Section 3.2.3.

3.2.2.3 West Option

The West Option has been divided into seven construction segments, as defined in Section 3.1.3.3.

Possible staging area requirements of Segments UPRR-W-U-1 and UPRR-W-U-2 match those of Segments UPRR-ROW-U-1 and UPRR-ROW-U-2, respectively.

Segment UPRR-W-U-3a staging area requirements match those of Segment UPRR-ROW-U-3.

Segment and UPRR-W-U-3b consists of new construction of crossings over the UPRR tracks and Prairie Avenue. These construction segments may require the following:

- Temporary construction easements on adjacent streets and parcels including parking lots, abandoned properties, and other adjacent properties. Temporary lane closures and shutdown of traffic may be required on Prairie Avenue.

Possible staging area requirements for Segments UPRR-W-U-4, UPRR-W-U-5, UPRR-W-U-6, and UPRR-W-U-7 match those of Segments UPRR-E-U-4, UPRR-E-U-5, UPRR-E-U-6S, and UPRR-E-U-6W, respectively.

Staging requirements of Segment UPRR-W-U-7 are discussed in Section 3.2.3.

3.2.3 120th Street Yard and Shop

The 120th Street yard and shop is considered construction segments UPRR-ROW-U-7, UPRR-E-U-7, and UPRR-W-U-7 for the UPRR Alternative options.

Possible staging area requirements for the yard and shop are minimal. Parcels would be acquired by CTA in the area and would provide most construction area requirements.

3.2.4 Halsted Rail Alternative

The Halsted Rail Alternative has been divided into five segments, as defined in Section 3.1.6.

Possible staging area requirements of Segment H-1 match Segment UPRR-ROW-U-1. Segment H-2 consists of new construction within the I-57 corridor and across northbound I-57 and Halsted Street. This construction segment may include the following:

- Temporary construction easements on the adjacent expressway requiring shoulder and lane closures as well as temporary shutdown of traffic.
- Temporary construction easements on adjacent streets, parks, and parcels including parking lots, abandoned properties, and other adjacent properties.

Segment H-3 and Segment H-4 consist of new construction within the Halsted Street corridor. These construction segments may require the following:

- Temporary construction easements on Halsted Street and adjacent streets, parking lots, abandoned properties, and other adjacent properties. Temporary lane closures and shutdown of traffic may be required on streets.

3.2.5 119th Street Yard and Shop

The 119th Street yard and shop is Segment H-5 for the Halsted Rail Alternative. Possible staging area requirements for the yard and shop are minimal. Parcels would be acquired by CTA in the area and would provide most construction area requirements.

3.3 Description of Anticipated Construction Activities and Methods

3.3.1 Basic Construction Activities and Methods

Construction for the UPRR Rail Alternative options and the Halsted Rail Alternative would be very similar. Construction activities and methods for these alternatives are discussed interchangeably in this section unless otherwise noted.

Off-site and staging yard assembly of construction items would be performed to the fullest extent possible, especially in Segments U-1 and U-2 of each alternative and Segment H-3 and Segment H-4 based on site-specific access requirements.

The construction matrix for each build alternative is presented as Attachment A. The construction matrix summarizes the construction activities that would be completed including potential construction equipment; estimated quantities of soil, concrete, and steel based on conceptual engineering; and estimated duration of construction activities. Section 4 presents the estimated construction schedule for the alternatives.

3.3.2 Preconstruction Activities

Contractor preconstruction activities would include development of construction schedules, quality plans, and procurement schedules. Process plans would be developed for coordination of work activities to match construction constraints and site access. Existing conditions would be verified for design and construction interface criteria. Survey control establishment would be essential to the verification of site, existing conditions, and utility conflict/relocation information.

Utility protection/relocation information would be coordinated and verified in the sequence of scheduled construction, far in advance of the early construction activities.

Community notifications would be initiated by the CTA and the contractor as early as possible to afford the community best fit conditions for understanding the construction schedule, neighborhood conditions, and related environmental impacts.

Demolition and building permits would be obtained at the earliest opportunity. Office of Underground Coordination requirements (e.g., shoring designs, support of excavation, drilled shaft procedures) must all be coordinated and approved before permits are issued.

The proposed UPRR Alignments are in a residential area coexisting with various homes, parks, schools, and businesses. Therefore, construction activities would be evaluated locally to ensure that the local dynamics of the area and the needs of the property owners and businesses, as well as the end users, are incorporated into the project. While the Halsted Rail Alternative would primarily affect commercial buildings, the aforementioned applies to the Halsted Rail Alternative as well.

Construction activities would include new, at grade, retained embankment, and elevated structure, station, substation, parking, yard, and access road construction. The following construction activities would be expected for the infrastructure and station construction.

3.3.3 Traffic Rerouting

During construction, vehicles, pedestrians, and buses may need to be rerouted around the construction site. Rerouting of traffic is normally done by using detours and complete street closures. The street closures may include main streets, side streets, and alleys and access points. To help mitigate the impacts on traffic routes, station and viaduct construction activities would be sequenced around these street and alley closures. However, complete closure of streets may not always be possible because residents and businesses would still need access. Therefore, temporary traffic lanes, temporary access points, or staged construction would be used. The following activities would be part of traffic rerouting activities:

- Construction signage and temporary traffic barriers.
- Temporary reduction (from two to one) in the number of thru-traffic lanes in each direction, if feasible.
- One-way traffic may be implemented on a temporary basis.
- Detours/complete street closures including alleys and access points.

- Temporary traffic lanes.
- Designated space for storage and staging of construction materials, equipment, and temporary facilities within and/or adjacent to the ROW.
- Construction vehicle access points within and/or adjacent to the ROW.
- Business, residential, and pedestrian impacts including limited parking or parking bans.

3.3.4 Demolition

All RLE alternatives require complete removal or partial demolition of existing buildings or structures. The demolition process would result in increased noise and debris. Work would be performed in accordance with local ordinances for construction activities. In general, pedestrian and vehicular traffic would not be allowed into demolition areas.

The demolition process may include concrete removal, requiring construction workers to saw cut, jackhammer, and/or knock out the existing concrete, cut or remove the existing reinforcement, or completely demolish existing concrete structures.

For removal of foundations and/or streets, to relocate existing utilities, or excavate existing ground, the contractor would excavate using bulldozers, compact tractors, or backhoes to dig and remove earth. The disposal material would be placed in dump trucks and trucked off-site. During excavation, temporary shoring may be required to protect adjacent buildings or structures.

Construction vehicles would access the construction site on a regular basis and would require special hauling routes to deliver materials and equipment to the site and remove the debris from the site. The routes may require complete street closures, temporary street shutdowns, or traffic rerouting. Depending on the type of material being removed, special handling of waste may be necessary. For example, older buildings with asbestos would require special handling. All materials would be disposed of in the proper manner, following federal, state, and local regulations.

3.3.5 Temporary Shoring

During demolition and excavation, temporary shoring may be required to protect adjacent property. The shoring would consist of steel sheet piling driven into the ground with a vibratory pile driver. The rig may be located within the construction zone or outside the ROW depending on the space limitations and access points. The temporary shoring may require the use of tiebacks. Tiebacks are long rods that would be drilled through the sheet piling, embedded into sound rock, or other approved materials, and then grouted into place.

3.3.6 Foundations

Due to the variety of structures, including CTA elevated structure, buildings, and parking garages, there would be a variety of foundations on the RLE Project. Foundations can consist of concrete spread footings, steel pile foundations, or concrete drilled shafts. Foundation type depends on site conditions and location. To determine the geotechnical properties of the soil, a geotechnical engineer would drill exploratory borings and take soil samples. The geotechnical engineer would then test the samples, determine soil properties, and make recommendations on the type of foundation to use, as part of the design process.

All types of spread or shallow type foundations would require excavation and removal of earth to form the concrete footings. As stated above in Section 3.3.4, the use of bulldozers, bobcats, or backhoes would be used to dig and remove earth. The earth may be placed in dump trucks and shipped off-site or stored for use on the construction site for backfill. Materials shipped off-site for disposal would be handled through approved facilities.

Large cranes with pile driving leads that help guide the piles into position would be used for installation of pile foundations. A diesel hammer would drive the piles into the ground by impact. A test pile would be driven to test the pile length and capacity. Based on soil properties, the test pile would determine whether piles would be driven to a different elevation, designed to a different capacity, or would encounter rocks or boulders in the ground. Pile shoes or pile tips would be added to the end of the piles or a pre-drilled hole supported by a steel casing would be used to aid the pile installation process. It is very important for the contractor to locate existing utilities such as sewer, or cable lines before excavation or pile installation to avoid damaging the services. Evaluation of nearby foundations may be required to prevent damage to existing structures during new foundation construction.

Drilled shaft construction is performed with a crane-mounted drill rig. An auger of the design diameter would be drilled into the ground and soil would be piled nearby for removal. As the auger advanced, extensions would be added to the supporting shaft. The drill hole would be fitted with a lining where required by unsuitable soils. A pre-formed reinforcement cage would be installed and concrete would be placed to form the drilled shaft support.

3.3.7 Concrete Placement

Part of the construction logistics and process plan would be to determine the concrete plant based on location and availability of the required concrete mix. The plant would supply and deliver the concrete to the site using concrete trucks. Temporary street closures and truck routes may need to be established to access the construction site. Coordination of multiple trucks may be necessary for large pours and may require special access and scheduling. The contractor may elect to create an on-site ready mix plant to supply the concrete if space limitations and location of the nearest concrete plant require it.

Before the concrete can be poured, all necessary reinforcement and concrete forms would need to be in place. The reinforcement would be delivered on large flatbed trucks and would be stored on-site in bundles. The contractor would assure that the number of bars (and the size of bars, spacing of bars, edge clearances, etc.) is per contract documents before the concrete is poured. The formwork may consist of large steel panels or plywood to hold the wet concrete in place. To maintain the weight of the concrete until it cures, the formwork would be braced or temporarily supported.

After arriving on-site, the truck would be positioned at the location required for the pour. If the truck could not access the location of the pour, the concrete would need to be placed by pump, conveyor system, or other method. Concrete would need to be poured within 1 to 1.5 hours after loading depending on the outside temperature and whether the truck has a retarder. During the pouring, workers would push and move the concrete into position. The concrete would be vibrated to eliminate any voids and smoothed to obtain a good finish. The concrete may need to cure for a week before forms can be removed. Concrete is typically not loaded for 28 days after placement.

3.3.8 Structural Steel Erection

Standard structural steel erection would be required for most new construction on the RLE Project. Structural steel can consist of plates, angles, girders, beams, columns, cross frames, and related elements. The steel can vary in size, length, weight, and use.

Steel members would be delivered to the site on large flatbed trucks or semi-trucks and could require special hauling permits. The construction zone would require special access areas so that the steel could be delivered, assembled on-site, stored, or moved into position. Cranes would be used to pick the pieces off the trucks, move the material overhead, and place into position. Iron workers would be located on the structure to help move the pieces into place by bolting or welding the members. The ironworkers would perform most of the steel erection procedures, which could consist of framing, bolting, welding, coping, cutting, hammering, and similar activities.

3.3.9 Equipment Definition

Demolition - Heavy equipment, efficiently sized to match available access and reach requirements, including cranes with a demolition ball, front-end loaders, shears mounted to backhoes, concrete breakers mounted to combination tractors or backhoes, dump trucks, and off-site tractors with dump trailers.

Excavation - Heavy equipment, efficiently sized to match available access and reach requirements, including backhoes, front-end loaders, concrete breakers mounted to combination tractors or backhoes, dump trucks, and off-site tractors with dump trailers.

On-site hoisting - Heavy equipment used to hoist or move materials about the construction site, efficiently sized to match available access and reach requirements, including telehandlers, front-end loaders, mobile cranes of varying sizes, crawler-mounted cranes, and track-mounted equipment.

Concrete Placement - Heavy equipment efficiently sized to match available access and reach requirements. If concrete trucks cannot directly access the pour location, concrete would typically be placed utilizing a truck/trailer mounted concrete pump(s) or truck/trailer mounted concrete /material type conveyors.

Steel Erection - Heavy equipment, efficiently sized to match available access and reach requirements, including truck cranes, all-terrain cranes, and mobile cranes of varying sizes. Crawler-mounted cranes would typically be used to hoist and erect steel members under normal conditions, while track-mounted equipment (rail-borne equipment) may be used where platform steel and precast materials, including canopy steel framing, track work materials, and similar cannot be reached from normal ground access locations or where there are limited staging area restrictions.

3.4 Methods for Protecting Nearby Utilities and Adjacent Structures

Methods for protecting nearby utilities and adjacent structures include standard industry practice techniques. These techniques include coordinating with existing utilities and field verifying locations. The Office of Underground Coordination (OUC) requires a review of foundations that are within two feet of the property line. Dig requests must be submitted to Chicago DIGGER (Chicago Utility Alert Network) for areas within the limits of the City of Chicago and JULIE (Joint Utility Locating Information for Excavators) for areas outside the City of Chicago limits before any excavation can begin.

3.4.1 Utility Identification

Major utilities can be found on the conceptual engineering plan and profile sheets for each of the build alternatives. Further work would be required to verify the location of all utilities for each alternative.

3.4.2 Industry Practice

- Designer of Record/Owner - Identify existing location (and condition) during preliminary engineering phase for foundation design. Develop review criteria for further coordination of new underground structures, for example, foundations, cable trenches, and ductwork.
- Coordination with existing utilities.
- Leave as is if no conflict.
- Field verify locations, if a potential conflict exists, during preliminary design phase.
- Determine need to protect, redesign to clear, or relocate to allow completion of design. May require a cost impact analysis for redesign versus relocate costs.
- Plat of Survey with location of existing underground structures, with size and location of all existing private and public utilities (below and above ground).

- OUC Review.
- Department of Water Management Review with water review and sewer review.
- Preconstruction - with contractor identification and location.
- Utility contact with digger location.
- Relocation cost.
- Coordination with contractor.
- Field verify locations.
- Pothole at caisson location prior to placing temporary liner.
- Coordination with all parties.
- Identify and protect/relocate away from construction zone all known cables/systems (typically: cable TV, AT&T, gas, electric, Chicago sewer and water, fiber optic, CTA signals, CTA communications, CTA traction power, and similar). May need specific plan written into project specifications delineating contractor responsibility.

3.4.3 Adjacent Structures

New structure protection would be provided along the UPRR track for structures within 50 feet of the centerline of the adjacent UPRR track. Structure protection would be a crash wall running parallel to the UPRR track per the AREMA Manual. If the proposed CTA structure would come within 18 to 25 feet of the centerline of the adjacent UPRR track, pier protection would be provided per the Manual for Railway Engineering (AREMA 2012) and Guidelines for Railroad Grade Separation Projects (BNSF Railway and UPRR, 2007).

For conflicts with existing adjacent structures, field verification of structure location during the design phase would be necessary to evaluate the potential conflict.

3.4.4 Foundations at Interface Areas

An OUC review is required for foundations within two feet of the property line within the City of Chicago. Earth retention systems, with a named sheeting contractor and with sealed earth retention design, are to comply with OUC restrictions.

3.4.5 Monitoring of Adjacent Structures

- The contractor would develop, obtain CTA approval for, and institute a program for monitoring settlement, noise, and vibration of buildings and structures on or adjacent to the ROW. Prior to mobilization, the contractor would survey (both physically and with photos and videos) existing conditions of all areas that are to be occupied, worked on, restored or affected in any way. The contractor would be responsible for and must repair or replace any portions of such areas damaged by his acts.

- Monitoring for settlement, noise, and vibration of buildings and structures on or adjacent to the ROW would start prior to the start of excavation, foundation work, work requiring the use of heavy equipment, or work which may cause damage to CTA or adjacent structures. Monitoring would accommodate vertical and horizontal controls.

- Settlement and vibration monitoring programs for specific structures and locations would be defined during design.

- Special provisions would be included in the construction documents to ensure that all monitoring requirements are completely outlined for contractor clarity.

Section 4
Project Schedule

The estimated project schedule to construct the proposed alternatives is presented in Attachment B. The schedule is based on unconstrained funding and design limitations. The schedule for each alternative assumes advance work that may take one to two years. The final engineering and advance work could start in 2018 and go through 2021. The advance work would consist of utility relocations, land acquisition, and other work necessary prior to starting heavy construction work. The heavy construction work is estimated to require three years and could be phased according to construction in the work segments. It is anticipated that the heavy construction work may occur during the 2022 through 2025, including one year of testing. With this construction schedule, the opening year of the RLE would be 2026.

Conditions/Assumptions used in the Construction Matrix

The intent of this Construction Matrix is to provide a general level of construction activity that may occur with each alternative and is to be used for the NEPA process. The Construction Matrix identifies a range of potential impacts based on currently available information and is not intended to be used for scheduling construction nor is it intended to be used for cost estimating construction.

Activity

Segments and grouping of activities based on the Conceptual Engineering Plan and Profile Drawings, July 2012, revised September 2012.
Work elements based on the Conceptual Engineering Plans.
Stationing based on the Conceptual Engineering Plan and Profile Drawings.
Trackwork is included with the listed activity.

Duration (Months)

Estimate of the expected duration of work for the activity row.
Activities are not sequential except for Advance Work if required in the segment.
Construction implementation and maintaining operations will have a significant impact on construction durations.

Construction Equipment

Possible types of construction equipment that may be used for some duration within an activity.

Soil (CY)

Represents the potential soil or aggregate that may be excavated, removed, or fill. Concrete removed is included in quantity.
Includes caisson and foundation excavation.

Concrete(CY)

Represents the potential quantity of new concrete including caissons.
Concrete at stations includes building and platforms. Concrete for track support included in Elevated Structure

Structural Steel (LB)

Represents the potential quantity of new structural steel.
Structural Steel at stations includes building and platforms. Structural Steel for track support included in Elevated Structure.

Avg Truck Trips Per Work Day

Estimated average number of truck trips for an activity per work day. Excludes minor vehicles and worker vehicles.

Ave. Workers Per Work Day

Estimated average number of workers for an activity per work day.

Stop Assumptions:

Stops will be constructed one direction of traffic at a time to reduce traffic due to construction activities and to reduce disturbance to existing bus services.

Stop construction start dates are staggered to reduce disturbance to existing bus service.

Traffic Signal Assumptions:

Eberhart Avenue signal constructed once 130th Street parking lot is near completion. Possible entrance of parking lot at Eberhart Avenue therefore signal shall be constructed after entrance to parking lot is constructed.

Traffic Signal Prioritization Assumptions:

Traffic signal prioritization assumes that light poles will be upgraded with detector and equipment. The installation is staggered to reduce traffic during construction activities.

Attachment C
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative–the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on transportation facilities that include public transportation, vehicular and freight traffic, bicycle, pedestrians, and parking.

Impacts on the transportation facilities were identified based on the predicted changes from the existing conditions to the horizon year of 2030, using the regional travel demand model. The impacts on transportation facilities were evaluated through a combination of qualitative and quantitative analysis. Section 3 presents the specific methods used to determine impacts. The following paragraphs describe the impacts and proposed mitigation measures for each alternative.

People using public transportation would benefit from the extension of the Red Line south from the 95th Street Terminal. Various bus routes within the project area would be rerouted to complement the rail alternatives and provide a means for connectivity to the expanded service. The extension of the Red Line would provide an alternative mode of travel to reach downtown Chicago (and destinations between downtown Chicago and 95th Street) for people south of the 95th Street Terminal. There would be no permanent adverse impacts on public transportation services for any of the alternatives. Temporary construction impacts on public transportation, including intermittent delays and detours, would occur.

The traffic analysis consisted of analyzing 76 intersections within the area of potential impact (API). Table 1-1 provides a summary of the intersections that would require mitigation measures to minimize the level of impact from any of the build alternatives. At intersections where adverse impacts are expected, potential mitigation measures have been identified to offset the portion of the level of service (LOS) deterioration that is attributable to the RLE Project. After mitigation, there would be no adverse permanent impacts from any of the build alternatives. The minimum acceptable LOS for roadway intersections is “D” for urban areas. Temporary construction impacts on traffic would occur during construction activities. The temporary impacts would be mitigated by following the applicable federal, state, and local requirements for construction activities.

There would be no permanent impacts on freight transportation due to the implementation of any of the build alternatives. There would be temporary impacts due to the construction of Union Pacific Railroad (UPRR) Rail and Halsted Rail Alternatives due to temporary closures of the roadways or highways to erect the aerial structures and superstructures. Railroad flagging would be included where any construction crosses or is adjacent to railroad operations.

There would be no adverse permanent impacts on pedestrians after mitigation for any of the build alternatives. Mitigation measures for pedestrians include the addition of traffic signal or pedestrian refuge islands and/or other pedestrian crossing treatments at the Kensington Avenue stop for the BRT Alternative. Mitigation measures for the UPRR Alternative alignment include pedestrian crosswalks and/or pedestrian crossing gates at the at-grade railroad crossings near the proposed UPRR Alternative alignment.

Bicycle facilities would not be affected by the implementation of the project alternatives. There would be temporary construction impacts on bicycle facilities for the Halsted Rail Alternative.

There would be no permanent impacts on parking. Minor parking impacts would occur during construction activities for the Halsted Rail Alternative.

Only the UPRR East Option and UPRR West Option have potential for cumulative impacts. With both the UPRR East Option and UPRR West Option, freight traffic would remain on the existing UPRR tracks. Although the project would not increase the number of freight trains, with increased traffic bound for stations (including bus traffic, bicyclists, and pedestrians), delays at the at-grade crossings may increase.

Updated July 27, 2015
In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix F of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix F supersedes information presented in other chapters of this technical memorandum.

Table 1-1: Summary of Mitigated Intersections within the Area of Potential Impact for the Build Alternatives

ID	Intersection	Existing (2012)		2030 Baseline		2030 BRT Mitigated		2030 UPRR Mitigated		2030 Halsted Mitigated
